Salvia corrugata — Lamiaceae !

INFO

Common Name:
Perennial Shrub
Height: 3.5-5ft. Spread: 3ft.
Flowers Blue Aug, Sept, Oct
Native Range: Columbia, Ecuador, Peru Andes
Description: Widely distributed in the Andes from southern Columbia to Peru, Salvia corrugata features deeply puckered, dark green foliage. While newly emerging leaves have downy, copper-colored undersides, each mature lance-shaped leaf has a sheen on top and contrasting grayish tomentose below. Light gray-green, fuzzy stems are crowned with showy racemes of deep blue flowers held by violet calyxes. This distinctive, upright Salvia makes a great specimen for the mixed border.

Record Notes: Name checked with The Plant List on 9/6/2011 by Mona Bourell.

Salvia desoleana — Lamiaceae !

INFO
Common Name: Sardinian sage
Perennial Herbaceous
Height: 2-3ft. Spread: 3-4ft.
Flowers Pale lavender with white
Native Range: Sardinia
Description: Salvia desoleana is a herbaceous perennial shrub native to the island of Sardinia in the Mediterranean. It is endemic to four or five specific locations on the island in sunny locations on limestone, granitic, and igneous rock. Salvia desoleana was named for the botanist Luigi Desole, and was first described in 1982.

It is a low-growing plant with elongated rhizomatous roots that grow parallel to the ground. Each plant forms a mound 2–3 ft (0.61–0.91 m) tall and 3–4 ft (0.91–1.2 m) wide. The ovate leaves grow as large as 8 in long (200 mm) by 6 in wide (150 mm), with both surfaces covered with hairs and glands, releasing a strong fragrance when crushed or brushed. The 1-foot inflorescences (0.30 m) have hairy stems, with evenly spaced whorls of six flowers, whose calyces include two 1-inch-wide (25 mm) leafy green bracts. The one-inch flowers have a pale lavender upper lip, and an off-white trough-shaped lower lip.[1]

Salvia discolor — Lamiaceae !

INFO
Common Name: Peruvian Sage
Perennial Shrub
Height: 12 - 18 " ; 3ft. Spread: 3ft.
Flowers Black, Dark Purple year-round
Native Range: Peru
Description: Salvia discolor (Andean sage) is a herbaceous perennial growing in a very localized area in Peru—it is equally rare in horticulture and in its native habitat. William Robinson wrote of its charms in 1933.

The plant is scandent, meaning that it climbs without the use of tendrils, with wiry white stems growing from its base. Mistletoe-green leaves of various sizes grow in pairs about 1-2 in apart on the stem, with the undersides covered in white hairs. The leaves, stem and flower buds all exhibit a strong and distinct odour of blackcurrant. The 1 in long deeply saturated dark purple flowers are held in a pistachio-green calyx, growing on 1 ft or longer inflorescences. The stems of the inflorescences are shiny and covered with glands, which frequently have insects stuck to them. It blooms during hot spells through summer and autumn and is a frequently grown ornamental on the French and Italian Rivieras, where it grows 3 ft high and wide.[1]

This plant has gained the Royal Horticultural Society's Award of Garden Merit.

Cultivation: Full sun to partial shade.
Record Notes: Name checked with The Plant List on 9/6/2011 by Mona Bourell.

Salvia disermas Lamiaceae !

INFO

Common Name:
Perennial Shrub
Height: 2ft. Spread: 2-3ft.
Flowers Pink Summer
Native Range: South Africa
Synonomy: Salvia rugosa Aiton; alvia fleckii Gürke (1898) ; Salvia rugosa var. angustifolia Benth.; Salvia rugosa Thunb. ; Salvia rugosa Thunb. var. rugosa (1800)

Description: Biol./Eco : biology: perennial -Shrub, Herb - Ht 0.3 - 1.2 m. Alt: 360 - 1555 m. Distribution: NAM, EC, FS, GA, NC, NW
Salvia disermas is a herbaceous perennial shrub native to South Africa, found in streambeds, moist forest, grassland, and disturbed ground. It was originally specified as rugosa, but was changed to disermas. It grows throughout west Africa, with its greatest concentration in South Africa, where it is used medicinally as a tea, and as a lotion for treating sores.
Salvia disermas is an evergreen that reaches about 2 ft (0.61 m) in height and width, with numerous stems growing from the rootstock, each with multiple inflorescences that curve upward. The icy white to pale mauve flowers are less than 1.5 in (3.8 cm) long and held in a small green calyx. The individual flowers are not showy, but the plant blooms profusely, and is rarely out of bloom. The long narrow leaves are pale apple-green with a fragrance similar to hay.

Cultivation: Water: Moderate; Light: Full sun; Hardiness: 20°F; Soil: Well-drained
Record Notes: Name checked with The Plant List on 3/6/2014 by Mona Bourell.

ACCESSION

Taxon Family Spelling Checked

Salvia divinorum Lamiaceae !

INFO
Common Name: yerba de la pastora, divine sage
Perennial Herbaceous
Flowers Blue Rarely
Native Range: Mexico
Description: Salvia divinorum, ceremoniously employed by the Mazatec Indians of Oaxaca, is endemic to the sierra inhabited by the Mazatec, its distribution anthropogenic. Plants spread vegetatively, fluorishing in shaded, humid sites, flowering sporadically from October until June. Flower nectar and corolla dimensions suggest ornithophily, and the only pollination event observed involved a single hummingbird, but other factors suggest that visits by birds to the flowers in their present range are opportunistic, and not a product of plant-pollinator coevolution. The species is diploid with n=11, pollen fertility is reduced, there is no active pollen tube inhibition within the style, but some event or process after the pollen tube reaches the ovary is aberrant, as no fully developed nutlet has ever been collected from a Mexican plant, and greenhouse cross-pollinations led to only 3% seed set. Hybridity is suggested, although intermediacy between two known species has not been recognized.
Record Notes: Name checked in IPNI, 5/24/2007.

Salvia dolichantha Ericaceae !

INFO
Common Name: clustered sage
Perennial Shrub
Height: 2-3ft.
Flowers Variable -rose pink to dark purple
Native Range: China: Sichuan
Description: Plants perennial. Stems (15-)35-80 cm, unbranched, with deciduous pilose hairs, subglabrous basally, striate in grooves. Petiole to 15 cm; leaf blade cordate-ovate to hastate-ovate, 6.5-9 × 5.5-9 cm, adaxially sparsely pilose, densely so on veins, abaxially subglabrous or pilose along veins, densely dark purple glandular, base cordate to hastate, margin double crenate-dentate, mucronate, apex acute. Verticillasters 3-6-flowered, in racemes 16-18 cm; rachis densely brown villous; bracts subcircular to ovate, margin ciliate. Pedicel 4-7 mm, densely brown villous. Calyx campanulate, dark purple to purplish when dry, 1.7-2 cm abaxially, 2-2.2 cm adaxially, villous on veins, glandular, glabrous inside; upper lip broadly oblate, ca. 6 × 13 mm; lower lip longer than upper, 2 teeth broadly triangular, ca. 5 mm, margin ciliate, apex acuminate; fruiting calyx dilated, membranous. Corolla dark purple, 4.5-5 cm, pendulous, subglabrous or pilose, finely pilose annulate inside; tube 3.5-6 cm, ca. 4 mm wide, abruptly dilated adaxially, to 1.3 cm wide at throat; upper lip straight, oblong, ca. 9 mm; middle lobe of lower lip subcircular, margin slightly crenulate; lateral lobes semicircular. Filaments ca. 9 mm; connectives semicircular, arms subequal. Style slightly exserted. Hills; ca. 3700 m. Sichuan.

Salvia dolomitica — Lamiaceae !

INFO
Common Name: South African Sage
Perennial Shrub
Native Range: South Africa
Description: Lovely grey South African shrub with 2-3cm lavender flowers in spring. Drought and frost tolerant. Height: 1m x 1m Gray-leafed shrub growing to 3' high and spreading by short rhizomes. Our mother plant is now about 5' wide. Muted gray leaves are elliptic and prominently veined on the undersides. Summer blooming, the flowers are pale lilac with a wide cream streak, extending into the throat. Inflorescence is short with a pea-green calyx covered with oily glands that smell of lemon. Full sun or light shade with well-drained soil. Drought tolerant once established, it has performed well in our garden with only occasional summer water. Found natively in rocky, dolomitic soils of the Trasvall. Hardy to 25F. South Africa.

1/14/2004 Tony Morosco — New accession request from Norm Degelman 1/14/2004, likely cuttings of this accession.

Taxon | Family Spelling Checked

Salvia dombeyi — Lamiaceae !

INFO
Common Name: Sacred Incan Sage
Perennial Herbaceous, Shrub
Height: 9-15ft. Spread: 2-3ft.
Flowers Red
Native Range: Peru, Bolivia
Description: This species may well have the longest flower of all Salvias. From 1.5 in. mahogany colored calyxes hang spectacular 3.5 in. scarlet flowers. Tubular and fuzzy, the flowers last for a long time amidst the viney stems and heart shaped, deep green leaves.
Semi-deciduous
scandent 'creeper', fantastic large red flowers on mature plants. Slow to establish and difficult to grow. Suitable for hot, humid districts. Summer-fall bloomer; best with some shade; good under story plant; needs support; protect from frost.
Cultivation: But the plant is sensitive to cold, so try planting under tall conifers or in some other protected spot. Provide rich, well drained soil and at least a half day of sunshine. For warm coastal areas. (Digging Dog Nursery)

Salvia dorisiana — Lamiaceae !

INFO

Common Name: fruit scented sage, peach sage
Perennial Herbaceous shrub
Height: 3-5ft. Spread: 6-8ft.
Flowers Hot Pink Jan, Feb, Mar, Apr, May, Jul, Aug, Sept, Oct
Native Range: Honduras
Description: a perennial shrub native to Honduras. It grows 1-1.3 m tall, and is heavily branched. The leaves have a fruity scent when brushed, and large magenta-pink flowers that bloom in winter. Salvia dorisiana was first described in 1950, and has become popular as a greenhouse plant. The flowers reach up to 5 cm in length, with a lime-green calyx about the same length. The entire plant is covered in hairs whose glands release a pineapple-grapefruit scent.[1]

Salvia dorisiana was apparently named after Doris, daughter of Oceanus and Tethys, and the wife of Nereus. She was mother to the fifty Nereids.

Cultivation: Light shade.
Record Notes: Name checked with The Plant List on 10/24/2012 by Mona Bourell.

Salvia dorrii 'Gayle Nielson' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Flowers Blue
Parentage: S. clevelandii, S. dorrii, and S. mohavensis.
Description: Salvia 'Gayle Nielson' (Lamiaceae). Garden hybrid, originating in Tucson,
Arizona; reportedly between S. clevelandii, S. dorrii, and S. mohavensis.
This plant greatly resembles Salvia dorrii: small, thickened, gray leaves, deep
lavender-blue flowers in small whorl-like clusters along 1 to 2 foot long
inflorescences. Unlike Salvia dorrii, this sage typically blooms in the winter.
Plants get woody quickly, and since they do not respond well to pruning
into old wood, they need to be pinched regularly during the growing season
and lightly pruned in fall. Mature plants are typically taller than wide, and
may reach 4 feet tall. Plants perform best in full sun and in well-drained soil.
Overwatered plants will be floppy. This, along with S. chionopeplica and
S. munzii are the earliest blooming "Californian" sages.
Cultivation: Plants perform best in full sun and in well-drained soil.
Overwatered plants will be floppy.
Record Notes: Name checked with The Plant List on 8/27/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia elegans — Lamiaceae !

INFO
Common Name: pineapple sage
Perennial Shrub
Height: 3-4ft. Spread: 2-3ft.
Flowers Red, Pink Feb, Mar, Apr, May, Jun, Jul, Aug, Sept, Oct, Nov, January
Native Range: Mexico
Synonomy: Salvia incarnata Cav.
Description: It is a tender perennial that will reach 3½ feet (1 m) tall in containers or in the ground. The 2-4 inch (5 -10 cm) long ovate leaves have the scent of pineapple when crushed and are used fresh or dry as a seasoning. Salvia elegans has a milder and fruitier taste than garden sage. They are hardy in USDA zone 9 but can be grown in zone 7 as an annual.

image of © 2011 Mona Bourell, SFBG2008-0598

Blooming Time: In the greenhouse, they bloom continuously from spring to fall. The bright red flowers are 1½ inches (4 cm) long and very showy.

Cultivation: Culture: Salvia elegans need full sun to partial shade with a well-drained soil mix. Use a soil mix consisting of 1 part peat moss to 2 parts loam to 1 part sand or perlite. The plants in containers are allowed to dry in-between waterings and they are fertilized on a weekly basis during the growing season. During the winter months, we water only enough to keep the plants from wilting. When grown outside in zone 7, they need some protection from the hot west afternoon sun.
Propagation: Propagation: Salvia elegans are propagated by cuttings or by seed.

Record Notes: Name checked with IPNI, 11/29/2007.

Salvia flocculosa — Lamiaceae !

INFO
Common Name: Ecuadorean blue sage
Perennial Shrub
Flowers Blue
Native Range: Ecuador
Description: from www.fbts.com/salvia-flocculosa.html : Blue Ecuadorian Sage) A beautiful, densely branched shrub with silvery leaves, this rare species was once thought to be S. cruickshanksii. In the California nursery trade, it has been called "Salvia 'Equador'". This is the true species, a great garden plant for warm areas.

We find this plant does best with ample water, but it is remarkably drought resistant if necessary. The warmer your garden is, the larger it grows. We have reports of monster plants 12 feet tall in the hills above the Monterey Bay.

The lovely mid-blue flowers are strongly marked with white, and seem never to stop. Especially in the warmth of summer this variety is one that blooms non-stop. It needs to be cut back occasionally so that new growth predominates.

Found in only six locations in the Andes at 8,000 to 9,000 feet, this is a species considered "vulnerable", one step short of endangered.

Great in containers, where it is a fine background for darker or glossy green leaves. It's ultimate cold tolerance is unknown, and may be a candidate for Zones 7 and 8.

Taxon Family Spelling Checked

Salvia fulgens Lamiaceae !

INFO
Common Name: cardinal sage
Perennial Herbaceous
Height: 4-5ft. Spread: 3-4ft.
Flowers Red
Native Range: Mexico
Description: A perennial herb native to the Mexican mountains adjacent to the state of Puebla, growing at 8,700-11,000 ft elevation. It prefers the edge of oak and coniferous woodlands, especially in clearings of Picea religiosa. The mountains receive fog and rain nearly year-round.

Salvia fulgens grows 4-5 ft high and 3-4 ft wide, and requires a long warm autumn for full blooming. The 2 in flowers grow in loose whorls, and are fire engine red, reflecting the common name and the synonym S. cardinalis. The upper lip has red hairs which glisten ("fulgens") in the morning dew. A reddish-brown calyx remains long after the flowers drop. Inflorescences are usually about 4 in long, though occasionally a 12 in inflorescence appears. The heart-shaped leaves are pale yellow-green, about 1.5 in long by 1 in wide, and cover the plant quite profusely.

It was introduced into horticulture in the 1800s and grown in Britain for many years

Record Notes: Name checked with TROPICOS, 8/12/2009.

Salvia gravida Lamiaceae !

INFO Common Name: gravid sage
Perennial Shrub
Flowers magenta red
Native Range: Mexico: Michoacán
Description: This tender but worth-the-work Sage from Michoacán, Mexico has very large, rich reddish magenta flowers that hang from the arching branches in flower clusters up to 12 inches long. This is a large plant with very attractive medium size leaves that creates an unforgettable display.
Wonderfully scented large hairy leaves and when laden with its trusses of cerise flowers, these hang like bunches of grapes. It grows to about 2 or 3m, being another of the large winter-flowering shrubby salvias. It needs support from cradle stakes as it is vulnerable to damage from winter wind and rain. Another option is to grow it nearby a shrub or small tree that it can lean into. It needs to be pruned hard in late winter and cut back again in late spring in an attempt to rein in its height.
"Gravid" means "with child" - and a plant loaded with it's full inflorescence does bring a pregnant woman to mind.

Grow this plant with the support of a trellis or against a wall. And do not underestimate its size!
Flowers in May, June, July, Aug

Salvia greggii Lamiaceae !

INFO
Common Name: autumn sage
Perennial Herbaceous
Height: 1-4ft.
Flowers Red May
Native Range: North America
Description: Salvia greggii (Autumn sage) is a herbaceous perennial native to a long, narrow area from southwest Texas, through the Chihuahuan Desert and into the Mexican state of San Luis Potosi, typically growing in rocky soils at elevations from 5,000-9,000 feet. It was named and described in 1870 by botanist Asa Gray after J. Gregg, a Mexican trader who found and collected the plant in Texas. It is closely related to and frequently hybridizes with Salvia microphylla. Contrary to its common name, it blooms throughout the summer and autumn.

Salvia greggii is a highly variable plant, with numerous named cultivars, reaching anywhere from 1–4 feet in height and less in width. It can be either upright or mounding. The leaves are typically mid-green and glabrous, tending to be less than 1 inch long. Flower size and color are extremely variable. Flowers reach from .25-1 inch in length, and include many shades of scarlet and red (most common in the wild), along with rose, white, pink, lavender, apricot, and violet. The plant is used widely in horticulture.

Popular named cultivars include 'Furman's Red', a cultivar from Texas that blooms profusely in autumn with dark red flowers. Big Pink has a large lower lip with a deep pink color and lavender tint. 'Purple Pastel' is a small variety that repeat blooms in autumn. 'Cherry Chief 'blooms reliably in the humid southern United States. 'Desert Pastel' has pale apricot flowers with yellow streaks, and prefers mild climates.

Salvia greggii 'Elk Pomegranate' — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 2ft. Spread: 2ft.
Flowers Dark pink
Description: From Flowers by the Sea:
Elk Pomegranate Autumn Sage) We're proud to say that this is an FBTS cultivar. It is one of the finest dark flowered, compact Autumn Sage varieties we have seen. Its extraordinarily large, raspberry blossoms bloom from spring into fall.

The large, luxuriant leaves are a bright Kelly green as are the stems and calyxes. Although it does well in full sun, it especially thrives in morning sun and afternoon shade. This heat-tolerant, drought-resistant sage is ideal in patio containers and along borders. It's also just the right size and look for a dry garden groundcover.

We aren't the only ones that love it. Butterflies, honeybees and hummingbirds frequently visit our Elk Pomegranate plantings. They highly recommend it and so do we.

Cultivation: USDA Zones
7 - 9
Exposure
Full sun to partial shade
Soil type
Well drained
Water needs
Average

Salvia greggii 'Texas Wedding' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 2ft. Spread: 2ft.
Flowers White
Description: From Plant Delights Nursery, Inc.:
(aka: Salvia greggii 'Alba') This poor plant has been tossed around the country for years without a legitimate cultivar name, so, in 2006, we officially christened it Salvia gregii 'Texas Wedding'. The floral show reminds us of a Texas shotgun wedding where the bride was just blown to smithereens by a jealous ex...I just adore those fun-loving Texans. Salvia greggii 'Texas Wedding' is a very hardy, upright sub-shrub to 2' tall x 2' wide. Adorning the deer-resistant woody stems and small, narrow, evergreen leaves are masses of hummingbird attracting white flowers produced continuously from late spring into fall, except for a floral slow-down in the hottest part of midsummer. Well-drained soils are best for all Salvia greggii. - See more at: http://www.plantdelights.com/Salvia-greggii/Texas-Wedding-for-sale/Buy-White-Texas-Sage/#sthash.QTpZ9kmR.dpuf

Salvia guaranitica Lamiaceae !

INFO

Common Name: blue anise sage, Brazilian sage, anise sage
Perennial Shrub
Height: 3-6ft. Spread: 3-6ft.
Flowers Blue Jun, Jul, Aug, Sept, Oct
Native Range: Brazil, Paraguay and northern Argentina.
Synonomy: Salvia ambigens Briq ; Salvia caerulea Moc. & Sessé ex Benth.; Salvia coerulea Benth.; Salvia melanocalyx Briq.

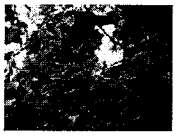

image of © 2005 David W. Kruse-Pickler, SFBG1991

Description: Blue anise sage is a semi-woody perennial subshrub with a loose, bushy, rather open form. It gets 3-5 ft (0.9-1.5 m) tall and just as wide, and has branched, dark green stems that are square in cross section. The branches and leaves are in pairs originating on opposite sides of the stems. The leaves are 2-5 in (5.1-12.7 cm) long, more or less oval in shape, slightly toothed, dark green, wrinkled above and pale green below. They do not smell like anise. The individual flowers are tubular, to 2 in (5.1 cm) long, with a hoodlike upper lip and a shorter, downward pointing lower lip. They are borne in showy 10 in (25.4 cm) spikes from early summer to late autumn.

Salvia haenkei — Lamiaceae !

INFO
Common Name: prawn sage
Perennial Shrub
Height: 6-8ft. Spread: 6-8ft.
Flowers Red
Native Range: Bolivia
Synonomy: Salvia avicularis Briq.; Salvia bridgesii Britton ex Rusby; Salvia pseudoavicularis Briq.

Description: Although the common name for this flaming red, Andean sage is based on its flower's resemblance to a shrimp head, its scientific name goes back to the days of late 18th century Spanish exploration of the Americas.

"Haenkei" honors German botanist Thaddäus Haenke, who was part of the Malaspina expedition to Bolivia, Peru and many other sites along the west coasts of Latin America and North America beginning in 1790. We won't go into detail here, but Tadeo -- as he was called by the Spanish explorers -- was a tough, resilient kind of person. How fitting that a tough survivor of a plant should be named after him.

Salvia haenkei grows quickly and can become more than 8 feet tall and wide. Yet it is a fine container plant, especially if cut back regularly to keep growth under control and tidy. It is one of the best hummingbird plants in its native habitat where it is also used as a culinary herb.

This fragrant, water-loving sage blooms from summer into fall. It is a dramatic addition to a lightly shaded garden in which it can sprawl a bit in a shrub border or cut-flower bed. If you live in an area colder than Zones 9 to 11, try it as a somewhat exotic bedding plant.

Cultivation: hardy to 20 deg
full sun
dormant in winter

Salvia hierosolymitana Lamiaceae !

INFO
Common Name: Jerusalem sage
Perennial Herbaceous
Height: 2ft. Spread: 2ft.
Flowers Wine red
Native Range: E Mediterranean
Description: It forms a mound of basal leaves that spreads to 2 ft, and slightly less in height. The ovate mid-green leaves are evergreen, lightly covered with hairs, and with a scalloped margin, growing 8-10 in long with prominent veining underneath. The 1 in or smaller flowers are a wine-red color, growing in widely spaced whorls, with 2-6 flowers per whorl. The lower lip is white, with wine-red spotting. The calyces are pea-green with red veins and bracts edged in red. The square stem of the 1 ft long inflorescences are also edged in red. Unlike many salvias, there is no odor when the leaves are crushed, and there is no known medicinal use of this plant.
A herbaceous perennial native to the eastern Mediterranean, with populations in Cyprus, Israel, Jordan, Lebanon, Syria, and the West Bank.[1][2] It typically grows in open fields, rocky soils, and among low-growing native shrubs. It was first described in 1853 by botanist Pierre Edmond Boissier, with the epithet "hierosolymitana" referring to "royal, sacred Jerusalem".

Salvia involucrata Lamiaceae !

INFO
Common Name: Rosy-leaf Sage, Rose Leaf Sage, Tarantula Sage
Perennial Herbaceous
Height: 3-4ft. Spread: 2-3ft.
Flowers Pink Sept
Native Range: Mexico
Description: This is a great back border plant. It can be more than 8 feet tall. It tends to be an upright grower. The inland valley heat works wonders with ample water and full sun. In its native Mexico it grows on the margins of forests. It seems to like but not require water once established. The biggest flowering season is in the fall. This plant is attractive to bees, butterflies and/or birds
Cultivation: Sun to Partial Shade. Average Water Needs; Water regularly; do not overwater. It gets frost damaged in the low to mid 20's.
Propagation: From herbaceous stem cuttings
Record Notes: Name checked with The Plant List on 8/6/2012 by Mona Bourell.

Salvia iodantha Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 10ft. Spread: 6ft.
Flowers Red, Purple Fall, Winter
Native Range: Central Mexico
Description: A herbaceous perennial, Salvia iodantha grows robustly to 10 ft or more and 6 ft or so in width. It tends to be scandent, and I have seen it supported by a deciduous tree with its flowering branches hanging from the tree's limbs in the late winter and early spring. The cyclamen-purple flower have velvety appearance due to the many small hairs that closely cover them.
Cultivation: A site sheltered from cool air and wind is essential. Sun for at least half the day throughout the year and deep waterking weekly are vital.
Record Notes: Name checked with The Plant List on 2/20/2013 by Mona Bourell.

Taxon | Family Spelling Checked

Salvia japonica — Lamiaceae !

INFO
Common Name:
Annual/perennial Herbaceous
Height: 1.5ft. Spread: 1ft.
Flowers White
Native Range: China, Japan
Synonomy: Salvia chinensis Benth.
Description: Plants annual. Stems erect, 40-60 cm, sparsely villous along angles or subglabrous. Leaves 1 -3-pinnate; petiole 7-9 cm; leaf blade 6-13 × 5-9 cm; upper stem leaves 1-pinnate, short petiolate; terminal leaflet lanceolate or rhombic, to 10 × 3.5 cm, pilose or glabrous, base long cuneate, margin obtusely serrate; lateral leaflets subsessile, ovate-lanceolate, 1.5-5 × 0.8 -2.5 cm, base obliquely rounded. Verticillasters 2-6-flowered, in terminal racemes or panicles; rachis densely glandular pilose or pilose; bracts and bracteoles lanceolate, 2-5 × 0.5-1 mm, glabrous, margin entire. Pedicel 1-1.5 mm, pubescent. Calyx tubular, 4-6 mm, sparsely glandular pilose, white hirsute annulate on throat inside, 2-lipped to ca. 1/3 its length; upper lip triangular or nearly semicircular, ca. 2 × 3 mm; teeth narrowly triangular, apex long acuminate. Corolla reddish, purplish, bluish, to white, ca. 1.2 cm, densely villous; tube obliquely pilose annulate inside, ca. 9 mm, exserted, ca. 2 mm wide at base, to 3.5 mm wide at throat; upper lip elliptic to ovate, ca. 2.5 × 2 mm; lower lip ca. 3 × 4 mm, margin crenulate. Stamens exserted; filaments ca. 1 mm; connectives ca. 6 mm, straight or slightly curved. Nutlets brown, ellipsoid, ca. 1.7 × 0.5 mm.
Native habitat: Hillsides, grasslands, wet areas, riverbanks, thickets, forests; 200-1200 m. Anhui, Fujian, Guangdong, Guangxi, Hubei, Jiangsu, Jiangxi, Sichuan, Taiwan, Zhejiang

Cultivation: Most happy in a warm, humid position. It does not seem to like too much direct sunshine. Regular watering seems essential in summer.
Propagation: It can be propagated by seed, possibly from cuttings. Spread naturally by runners.
Record Notes: Name checked with IPNI, 9/15/2008.

Salvia karwinskii — Lamiaceae !

INFO
Common Name: Karwinski's Sage
Perennial Shrub
Height: 8ft. Spread: 4ft.
Flowers brick-red, rose-red, to scarlet Feb, Mar,Apr, Sept, Oct
Native Range: Central America: Mexico - Nicaragua
Description: Salvia karwinskii (Karwinski's sage) is a perennial shrub native to the moist mountain forests of Mexico, Guatemala, Honduras, El Salvador, and Nicaragua, typically growing in or near pine or oak forests at 4,000 to 8,000 feet (1,200 to 2,400 m) elevation. It is known as a honey-producing plant in those areas, but is rarely seen in private gardens. Specimens are grown at Strybing Arboretum, Huntington Botanical Garden, and University of California Botanical Garden.

In California gardens, it reaches 8 feet tall and 4 ft wide (2.4 by 1.2 m), and in the wild it reaches up to 12 ft tall (3.7 m). The 1 in flowers are inflated and have two lips, ranging in color from brick-red, rose-red, to scarlet, and are carried on many 15 in racemes. The calyx is a showy dark-red, about 0.5-inch long (1.3 cm). The stems and petioles of the leaves have short wooly hairs, making them appear gray. The 6-inch (15 cm) rough leaves are evergreen, with veining on the underside and light cream-colored hairs

Salvia lanceolata Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-6ft. Spread: 2-4ft.
Flowers dull rosy brown
Native Range: South Africa
Synonomy: Salvia hastifolia Benth., Salvia nivea Thunb.

Description: biology: perennial -Shrub - Ht 1 - 2 m. Alt: 15 - 1500 m. Distribution: NC, WC

Salvia lanceolata is a perennial shrub native to a small area of coast on the Cape of Good Hope in South Africa. It is typically found growing in sandy ground at sea level, and on dry hills and flat ground up to 1000 feet elevation. Jean-Baptiste Lamarck, a pioneer in evolutionary theory, first described and named the plant "lanceolata" in 1791. Swedish botanist Carl Peter Thunberg, who was delayed in South Africa on the way to Japan, first collected it nearly twenty years earlier, along with approximately 3,000 plants that he later described. It wasn't until 1800 that Thunberg gave the plant the specific epithet "nivea", to honor Scottish gardener and plant collector James Niven. Because of the rules of nomenclature, Lamarck's name had precedence because he was the first to name it.
Salvia lanceolata is a much branched shrub growing 3 ft tall and 2-4 ft wide, with stems that become woody and light tan as they age. The leaves are lanceolate and evergreen, thick textured, and dove-gray with a green undertone. The .5 inch long calyx expands to 1 inch after the flowers are fertilized, turning pink. The 1.5 inch flowers are an unusual dull rosy brownish color. The plant blooms sparsely over a long period, from May through November [in S. Africa ?].
When crushed, the leaves give off a light fragrance reminiscent of lemon pepper, and are used in South Africa for cooking, most commonly with fish.

Record Notes: Name checked with The Plant List, 3/7/2011.

Salvia libanensis Lamiaceae !

INFO Common Name:
Perennial Shrub
Height: 10ft.
Flowers Red
Native Range: Colombia
Description: All Salvia in this section are deciduous but as this species is very rare it is not known whether it will be

Almeda notes from the field in Columbia: there are red calyx and green calyx forms

Salvia libanensis is a perennial shrub that is endemic to the northwestern slopes of the Sierra Nevada de Santa Marta in Colombia, growing at elevations between 2,000 to 2,200 m (6,600 to 7,200 ft). S. libanensis is a vigorous and spectacular plant reaching 3 m (9.8 ft) tall, with ovate leaves that are 7 to 12 cm (2.8 to 4.7 in) long and 3 to 8 cm (1.2 to 3.1 in) wide, hairy on both surfaces, with a paler underside. The inflorescence is of terminal racemes, with a 6 cm (2.4 in) red corolla.[
Record Notes: Name checked with TROPICOS, 5/23/2011.

Salvia lyrata 'Purple Volcano' Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Description: This impressive, fine new variety has been specially bred as a foliage plant, with rosettes of deep bronze-purple leaves. Beautifully veined and held in outstretched layers on low-growing plants, they keep their colour through summer as the plant grows quickly to its mature size. In autumn, the plant transforms itself again, the foliage turning bright crimson and scarlet. And when frost comes, this plant keeps its aboveground growth, remaining evergreen in all but the harshest climates.

From mid-spring through early summer, they are topped by long, slender stems crowded with small, delicate blooms that open pale purple and mature to silver and white, which themselves, on an ordinary green-leaved plant, would gain much attention.

Cultivation: This is a self-sowing plant, so it makes a fine mass planting in open settings and large areas. It tolerates sun or shade, and thrives in just about any well-drained soil, from heavy clay to sand, from rich loam to poor dry dust.
Record Notes: Name checked with The Plant List on 7/10/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia macrophylla Lamiaceae !

INFO
Common Name: Tingo Blue
Perennial Herbaceous
Height: 3.3ft.
Flowers blue Aug-Dec
Native Range: Ecuador - Peru
Description: Salvia macrophylla is a perennial undershrub native to Colombia, Peru, and Bolivia. In Colombia it is a rare plant, found growing on roadside banks in the south, at elevations from 1,400 to 2,400 m (4,600 to 7,900 ft).

The plant has many decumbent and upright stems reaching 1 m (3.3 ft) high and spreading into a large bush. The triangular-hastate leaves are 10 to 20 cm (3.9 to 7.9 in) long and 8 to 15 cm (3.1 to 5.9 in) wide, and violet on the underside. The leaves have many glands, and are sticky and aromatic. The corolla is blue, 2.5 cm (0.98 in) long, with the upper lip smaller than the lower, growing on 15 to 25 cm (5.9 to 9.8 in) branches.

This very attractive perennial originated from a seed collection by J.Mark Porter for Rancho Santa Ana Botanic Garden. It has wide heart shaped leaves, and grows like a squash along the ground. Some stems rise to 2-3' and carry a long series of lime green calyces from which bright blue buds develop into gentian blue flowers with a severely swept back lower lip. Styles and stamens are lightly blue flushed too. Probably tender to frost. Easy and fast.
http://www.seedhunt.com/salvia.htm

Record Notes: Name checked with The Plant List on 9/6/2011 by Mona Bourell.
Jeannie Rich 2006, requested this new accession with common name, Graham's Sage, which I could not find associated with this species.

Height: 4-5ft.
Flowers Blue
Cultivation: This is the more commonly distributed form of S. macrophylla, and it is more durable than its close relatives, S. sagittata and S. scutellarioides. It will bloom freely in cool weather.
It has a growth habit like a squash, spreading rapidly along the ground and rooting as it goes.
Frost tender but sets plenty of viable seeds and will root easily from cuttings.
Record Notes: Name checked with The Plant List on 10/1/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia madrensis Lamiaceae !

INFO
Common Name: Forsythia Sage
Perennial Shrub
Height: 4-7ft.
Flowers Yellow Summer - Fall
Native Range: Mexico
Description: Flowers to 12 inches, numerous inflorescences, calyces fragrant and sticky. Has spreading rootstock
Cultivation: Hardy to 25 degrees, needs good water. Light to medium shade, well drained soil with humus added.
Propagation: Can be divided in a few years, or increased by cuttings.
Record Notes: Name checked with Tropicos on 10/16/2011 by Mona Bourell.

Salvia melissodora — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 8ft. Spread: 5ft.
Flowers Lavender
Native Range: Mexico
Description: Salvia melissodora is a woody shrub that grows up to 6 feet high and 4 feet wide, with a graceful and upright habit. The 1-1.5 inch ovate leaves are mid-green on the upper side, with prominent veins on the lower surface that stand out due to the chamois-colored hairs that cover them. The partially dry leaves give off a pleasant fragrance, while the flowers are frequently described as grape-scented. The short inflorescences have several whorls each, with flowers that are violet-lavender on the upper lip and pale lavender on the lower lip and back of the upper lip. The flowers are full of nectar, and attract bees, butterflies, insects, and hummingbirds from late spring until frost.
Native to elevations from 4,000-8,000 feet in the Sierra Madre Oriental mountain range in Mexico, from Chihuahua in the north to Oaxaca in the south. The Tarahumara have used the leaves and seeds for medicinal purposes for several hundred years. The specific epithet "melissodora" comes from the Greek "melissa" (honeybee) and "odora" (fragrance)—the fragrant and nectar-filled flowers attract many insects. Melissa is also the name of a Cretan nymph in Greek mythology who collected honey.[
Record Notes: Name checked with TROPICOS, 1/21/2011.

Taxon | Family Spelling Checked

Salvia mellifera — Lamiaceae !

INFO
Common Name: black sage
Perennial Shrub
Height: 4ft.
Flowers White to pale blue or lavender, rarely pale rose
Native Range: California
Description: Shrub, rarely prostrate, 1–2 m; hairs simple, some glandular
Leaf 2.5–7 cm, oblong-elliptic to obovate, puckered, upper surface ± glabrous, lower surface hairy
Inflorescence: clusters 1.6–4 cm wide; bracts oblong-elliptic to widely ovate, acute to spine-tipped, generally = calyx
Flower: calyx 6–8 mm, hairs wavy, upper lip minutely 3-lobed; corolla tube 5.5–9 mm, white to pale blue or lavender, rarely pale rose, upper lip 2-lobed; stamens and style slightly exserted
Fruit: nutlet 2–3 mm, generally brown
Chromosomes: 2n=30
Ecology: Common. Coastal-sage scrub, lower chaparral
Elevation: 0–1200 m.
Bioregional distribution: Central Western California, Southwestern California
Distribution outside California: n Baja California

Salvia mellifera 'Terra Seca' — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 2ft. Spread: 6ft.
Flowers White/pale blue
Description: Selected by Louis Edmunds, this spreading form of the Black Sage forms a mat 2' tall and 6' wide. The flowers appear in March to May and are white with just a touch of pale blue, contrasting nicely with the dark green foliage. The species is native to dry slopes in the Coast Ranges from San Jose to Baja.

Cultivation: This species is very sun and drought tolerant, but will also take more shade and water (with good drainage) than most other native sages. It will also take clay soils if there is a slope to the ground. Fast growing, good for erosion control, and very deer resistant.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with an internet search, 6/15/2010.

Taxon Family Spelling Checked

Salvia mexicana Lamiaceae !

INFO Common Name: Mexican sage
Perennial Herbaceous
Height: 5-10ft. Spread: 3ft.
Flowers Blue, Purple Summer - Fall
Native Range: Central Mexico
Synonomy: Sclarea mexicana (L.) Dill.
Description: S. mexicana is good as a medium size shrub. It maintains a neat, symmetric bush shape. It could be used as an understory plant or on the edge of a wooded area. It is possible to plant smaller plants underneath Mexican sage since its overall shape is uniform and it does not spread out significantly.
n warm climates, Mexican sage can get as big as 12 ft (3.7 m) tall but in cultivation it usually maxes out around 5 ft (1.5 m) tall with a spread of 3 ft (0.9 m). It has blue flowers and various calyx colors. Mexican sage is highly variable in both leaf form and flower details. This is a fall-blooming sage with nice form and rugged character. The interesting foliage carry S. mexicana in the garden until autumn when its late blooming period commences and it becomes the star of the show. Unlike many of the salvias, Mexican sage does not have a strong scent.

Cultivation: Mexican sage thrives in high temperatures. It tolerates clayey soils, but still requires good drainage.
Light: Mexican sage does best with morning sun and partial or dappled shade at midday.
Moisture: Provide moderate water in hot climates. In the Austin, Texas area Mexican sage does well with 1/2-1 in (1.3-2.5 cm) of water per week in the summer. Growth continues even through very hot summer periods as long as supplemental water is available.
Hardiness: USDA Zones 8 - 11. S. mexicana can take some frost and will freeze back to the ground as temperatures fall into the lower 20s (°F). In areas with less frost and warmer temps it likely will keep its foliage year round. In my south central TX garden S. mexicana is rivaled only by S. involucrata and S. madrensis for rapid growth as temperatures rise in the early spring. Mexican sage can be grown as an annual in cooler climates. The cultivar 'Minor' blooms earlier, and is therefore useful in cool climates.
Propagation: Propagation: Propagate Mexican sage from tip cuttings taken in summer. Mexican sage is easy to start from seed, but it may be hard to find a seed source

Salvia mexicana 'Huntington Garden' Lamiaceae !

INFO Common Name:
Perennial Shrub
Height: 6-8ft.
Flowers Blue with black caylx. Sept, Oct, Nov, Dec, Jan, Feb, Mar, Apr, May
Description: These are from Huntington Garden.. The clone produced large, deep blue flowers, extended horizontally in whorls from a black calyx, on 12" to 20" spikes. Grows 6'-8' tall and wide-though can be cut back in Summer to form a shorter blooming plant. Very multi-branching, it bears lovely heart-shaped leaves of a rich green color. Blooms Fall thru Spring. Loved by hummingbirds of course!
Cultivation: Frequently dies after 2-4 years.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Salvia mexicana 'Limelight' Lamiaceae !

INFO Common Name:
Perennial Shrub
Height: 6ft. Spread: 2-3ft.
Flowers Blue violet
Description: Salvia mexicana 'Limelight' (Mexican Sage) - Evergreen, herbaceous perennial from central Mexico. Tall stems, up to 6 feet + and 2-3 feet wide produces an outstanding show of chartreuse green and violet-blue flowers from late summer through fall. Light gray-green foliage clothe the entire plant providing a full appearance. . A lovely cultivar from the Quertaro Province of Mexico. Introduced by Robert Ornduff in 1978 for the University of California Botanical Garden in Berkeley.
Cultivation: Prune heavy in late spring and moderately throughout summer to maintain good form. Works well in full sun to light shade. Prefers moderate water during the growing season. It will thrive on ample water and fertilizer but the stems can become even more fragile. Protect from hard freezes, root hardy to 20 degrees
Record Notes: Name checked with The Plant List on 10/16/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia meyeri — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 5ft. Spread: 5ft.
Flowers Blue
Native Range: Argentina
Description: This is a hardy species from Argentina. A large plant 5ft. x 5ft. which has masses of large, light blue flowers with white markings on the lower lip. There is also a form with pure blue flowers. Flowering starts in late June, and will last until frost, when the plant will appear to have died. However, it will resprout in Spring. To encourage flowering, S. meyeri should be deadheaded. Easily rooted from cuttings, many seeds can also be collected. It seems to prefer a sunny spot, but regular watering is essential in dry periods. The correct name of this species may be Salvia rhinosina, this is still under investigation.
Record Notes: Name checked with IPNI, 8/4/2008.

Salvia microphylla 'Flower Child' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 1.5ft. Spread: 2ft.
Flowers Lavender pink
Description: From Monterey Bay Nursery:

a single branch sport found growing on 'Berzerkeley,' this is a very compact, mostly erect grower with darker green foliage and a tighter habit. It sports intense, light lavender pink flowers, much closer in color to the S. microphylla'UCB' parent, but lighter in shade, and with wonderful, contrasting, dark blue purple to purple black sepals and flower stems. Its color varies in intensity with temperature, being darker and bluer under cool conditions and fading to paler, more salmon pink in summer. It is a much more compact variety, mostly upright, with excellent flower production. The flower color is an improvement over the already sublime 'Berzerkeley' but it grows with a slightly more compact, discrete habit. MBN INTRODUCTION - MAY 2009
Cultivation: Full sun, good water, good drainage
Record Notes: Name checked with The Plant List on 8/30/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia microphylla 'Hot Lips' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 2-4ft. Spread: 3-6ft.
Flowers White, Red
Description: Salvia microphylla 'Hot Lips' was found near the Chiapas area of Mexico and was introduced by Richard Turner of the Strybing Arboretum in San Francisco, California. This is a unique bi-color salvia that has red tips and white lips. In the hotter months of summer it may have all red and all white flowers on the same plant due to warmer night temperatures, but when the night temperature drops in the fall the flowers will return to their bi-color state. This Salvia has a similar look to Salvia greggii except it has a finer texture and smaller leaf. Hot Lips Sage seems not to have some of the leaf spot and defoliation problems that you can get with the greggii's during high humidity situations, great for use in borders and beds. Salvia microphylla 'Hot Lips' can reach 30" tall and spread up to 6' at maturity. the name "Hot Lips" chosen by volunteer propagators at S.F. Bot..

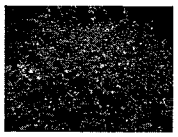

image of © 2005 David W. Kruse-Pickler, SFBG2001

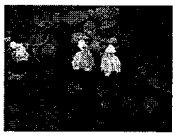

image of © 2005 David W. Kruse-Pickler, SFBG2001

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: A Strybing introduction to the horticultural trade in 2002. Name updated 4/22/2005 from Salvia microphylla 'Hotlips' to Salvia microphylla 'Hot Lips' per article by Dick Turner in *Pacific Horticulture* V. 65 No 4. 2004.

Salvia microphylla 'Mesa Azure' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 2ft. Spread: 1.5ft.
Flowers Light purple
Description: From Flowers by the Sea:
(Azure Hybrid Sage) Despite its name, the flowers of this tiny hybrid aren't really blue. They are a light purple. Due to its size, long bloom time, heat tolerance and drought resistance, Salvia x 'Mesa Azure' is a fine groundcover for areas where summers are hot and dry.

This sage may be related to Salvia microphylla and S. greggii, which are native to the American Southwest as well as Mexico. Its parentage is a mystery. However it displays many traits from those plants, including being an excellent choice for dry or native gardens.

Garden uses include short borders, flower beds, edging for pathways and containers. Azure Mountain blooms in waves from spring to fall in USDA Zones 7 to 9. Hummingbirds enjoy its nectar.

Aside from unusually large flowers, Azure Hybrid Sage is dense with large, wrinkled, heavily veined leaves. The foliage is so handsome that the plant is attractive even when out of bloom.

For the record, this sage also grows well in cooler climates, such as coastal areas. Limit watering, because it likes soil on the dry side. Provide a location with full sun to partial shade.

Record Notes: Name checked with The Plant List on 5/6/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia miltiorrhiza !

INFO
Common Name: red chinese sage
Perennial Shrub
Flowers Purple-blue or white
Native Range: China, Japan
Description: Plants perennial. Taproot thickened, succulent, scarlet outside. Stems erect, 40-80 cm tall, villous, much branched. Leaves simple to odd-pinnate; petiole 1.3-7.5 cm, densely retrorse villous, petiolule 2 -14 mm; leaflets 3-5(-7), 1.5-8 × 1-4 cm, blades or leaflets circular to broadly lanceolate, pilose, densely so abaxially, margin crenate, apex acute to acuminate. Inflorescences densely villous or glandular villous; verticillasters 6- to many flowered, basally remote, apically crowded, in terminal or axillary racemes 4.5-17 cm; bracts lanceolate. Pedicel 3-4 mm. Calyx campanulate, purplish, ca. 1.1 cm, slightly dilated after anthesis, sparsely villous or glandular villous, margin ciliate; upper lip entire, triangular, ca. 4 × 8 mm, apex 3-mucronate; lower lip almost as long as upper, 2-toothed. Corolla purple-blue or white, 2-2.7 cm, glandular pubescent, densely so on upper lip; tube imperfectly fine pilose annulate inside, exserted, shorter than limb, 2 mm wide at base, to 8 mm wide at throat; upper lip 1.2-1.5 cm, falcate; lower lip shorter, middle lobe ca. 5 × to 10 mm, 2-lobulate; lateral lobes rounded, ca. 3 mm wide. Filaments 3.5-4 mm; connectives 1.7-2 cm. Style much exserted. Nutlets ellipsoid, ca. 3.2 × 1.5 mm. Fl. Apr-Aug, fr. Sep-Oct.
Native habitat: Hillsides, streamsides, forests; 100-1300 m. Anhui, Hebei, Henan, Hubei, Hunan, Jiangsu, Shaanxi, Shandong, Shanxi, Zhejiang [Japan]

Record Notes: Name checked with Flora of China,

Salvia muelleri Lamiaceae !

INFO
Common Name: royal purple sage
Perennial Shrub
Height: 2.5ft. Spread: 2.5ft.
Flowers Purple Fall
Native Range: Mexico: Nuevo León
Description: Salvia muelleri looks like a softer version of Salvia greggii with green leaves on a low green shrub. It has typically grown 2.5' tall by the same width. I love the rich purple blooms. It is almost always carrying a few. I have not had any cold damage. I have grown it in full sun to light shade and it has performed well in both. Plants are much less prone to breakage than Salvia greggii.
Cultivation: Full sun, good drainage, rich humus added; weekly water when established.
Record Notes: Name checked with The Plant List on 5/19/2014 by Mona Bourell.

Salvia namaensis Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 3ft.
Flowers White
Native Range: South Africa, Namibia
Description: South. Afr. : biology: perennial -Shrub - Ht 0.3 - 1.2 m. Alt: 366 - 1465 m. Distribution: NAM, FS, LP, NC, NW, WC
Salvia namaensis is an evergreen perennial shrub native to a limited area in Namibia and a wide area of South Africa. It is typically found growing on rocky slopes, shales, limestone hills, and sandy soils at 1,000 to 5,000 feet elevation. The specific epithet namaensis probably refers to the Nama tribe which is indigenous to Namaqualand, the region in Namibia where the plant grows
Salvia namaensis is a slightly woody shrub that reaches 3 feet tall and wide. The small leaves (.75 inch) are irregular and pinnatifid, giving the plant an airy appearance. The leaves are yellow-green, along with the new stems and calyx. The short inflorescences, about 4 inches long, have 2 to 6 flowers growing in each whorl. Flowering is typically light, with white or very pale blue corollas that are about .6 inches long. There are reportedly some that have mauve flowers
Record Notes: Name checked with The Plant List on 6/11/2013 by Mona Bourell.

Salvia napifolia — Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers Purple
Native Range: Turkey
Description: Salvia napifolia is a herbaceous perennial native to Turkey and islands off its west coast, growing at elevations between sea level and 3,000 feet. Its natural habitat is maquis shrubland, rocky slopes, and disturbed roadsides. It was described by Nikolaus Joseph von Jacquin in 1773, with the specific epithet napifolia referring to the leaves being shaped like a turnip.
Salvia napifolia is small and clumping, with many upright stems, and soft leaves lightly covered with hairs. Widely spaced and dense whorls of flowers grow on 1 foot inflorescences, with several inflorescences coming into bloom at the same time. The tiny flowers are pale lavender to purplish violet, with equal length calyx and corolla, measuring about .5 inch in total length.

Salvia nubicola — Lamiaceae !

INFO
Common Name: Himalayan Yellow Sage
Perennial Herbaceous
Height: 3ft. Spread: 1.5ft.
Flowers Yellow
Native Range: Afghanistan, Bhutan, India, Pakistan
Description: Drought hardy small perennial. Winter dormant. Lemon flowers. Sets seed. Suitable for sun or shade. Nubicola translates as "dweller among the clouds," and the name proclaims its hardiness. The robust, erect stems of this bushy Himalayan native support a wealth of yellow-flowered spires, each bloom warmed by tiny maroon spots and held by bright green calyxes, along with a plenitude of large, arrow shaped leaves.

Taxon | Family Spelling Checked

Salvia officinalis 'Tricolor' — Lamiaceae X

INFO
Common Name:
Perennial
Description: From MO Bot Gard:
Tricolor sage is a cultivar of the culinary sage familiar to most cooks. It is perhaps grown primarily for its ornamental qualities (tricolor foliage), but it also has culinary properties. It is a compact, shrubby perennial which typically grows 1-1.5' tall and features wrinkled, oblong leaves (to 4" long) which are marbled with grayish-green, white and purple and edged with pink. Leaves are strongly aromatic and may be used fresh or dried in cooking. Whorls of two-lipped, lavender-blue flowers (to 1 inch long) in short, upright spikes appear in late spring. A mint family member that is attractive to bees and butterflies.

Cultivation: Grow in average, dry to medium moisture, well-drained soil in full sun. Tolerates very light shade, but best in full sun. Wet and/or poorly-drained soils can be fatal.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 7/2/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia omeiana — Lamiaceae X

INFO
Common Name:
Perennial
Native Range: China
Description: Plants perennial. Stems erect, 40-100 cm, robust, to 6 mm in diam. at base, striate, puberulent or subglabrous. Stem leaf blades broadly cordate-ovate to hastate-ovate, 10-16 × 6.5-14.5 cm, adaxially sparsely fine strigose, abaxially purple, sparsely puberulent along veins, sparsely yellowish glandular, base cordate to subhastate, margin double crenate or dentate, apex acuminate or caudate-acuminate. Verticillasters 2(-6)-flowered, widely spaced, in raceme-panicles; rachis glandular pubescent or subglabrous; bracts lanceolate to broadly ovate, 5-8(-10) × 1.5-3 mm. Pedicel ca. 2 mm, glandular pubescent or subglabrous. Calyx narrow campanulate, 1-1.5 cm, glandular pilose on veins, sparsely yellowish glandular; upper lip subtruncate, entire, apical mucro 1-2 mm; lower lip longer than upper, teeth triangular, apex acuminate; fruiting calyx dilated, ca. 1.3 cm wide at mouth. Corolla yellow, 2.5 -3.5 cm, puberulent outside; tube gradually dilated adaxially at apex, curved upward from base, ca. 2-3.5 cm; upper lip broadly ovate, 7-8 × ca. 3.5 mm; lower lip longer than upper, middle lobe obcordate, ca. 4 × 6 mm; lateral lobes ca. 3 mm wide. Filaments ca. 6 mm; connectives arcuate, ca. 6 mm, arms subequal. Style exserted. Nutlets obovoid, ca. 3 mm in diam., brown. Fl. Jul-Sep.

Bracts lanceolate to broadly lanceolate, apex long acuminate, shorter than calyx; corolla tube without hairy annulus inside

* Forest margins, hillsides; 1400-3100 m. Sichuan

11/10/2009 David Kruse-Pickler — No plants found in bed 24B. Record deaccessioned. 1 plant, 11/4/2005 planting date; 11/4/2005 last checked date by Patrick Quinn. Notes; white tag, with UCBG Acc #81.0969

11/16/2005 Mona Bourell — Patrick Quinn moved one plant from nursery to 24B 11/4/2005.

8/24/2005 Tony Morosco — Found out from UC Berkeley Botanic Garden that their 81.0969 is a D.E. Breedlove collection #55681, so is the same as our 1984-0219, which we lost in the 1991 freeze. Added wild location details.

8/24/2005 Tony Morosco — Don passed on information verbally that this plant is the "Cabrillo College Form" of Salvia pulchella, with light, lime-green leaves. The plant was received by Don from someone at Cabrillo College, who reports that it came from UC Berkeley Botanic Garden Accession number 81.0969 from Chiapas State. Emailed Holly Forbes and Barbara Keller requesting collection

Salvia purpurea Lamiaceae !

INFO
Common Name: purple sage
Perennial Shrub
Height: 1-2 [7?]ft.
Flowers Purple
Native Range: Mexico: Chiapas - Central America
Description: Salvia purpurea is a herbaceous perennial that is native to several Mexican states and south into Guatemala, El Salvador, and Honduras. It was first described by Antonio José Cavanilles in 1793, though its use in horticulture is only recent and it is rarely sold by nurseries.[1]

image of 2002 Strybing Arboretum Society

Salvia purpurea reaches up to 7 feet in height, less in width, with ovate yellow-green leaves that have serrated edges. Inflorescences begin appearing in mid-autumn, with the plant blooming into winter. The flowers are a pinkish purple-violet, in tight verticils that look like they are unbalanced on one side of the flower spike. The .75 inch flowers are tightly packed at the end of many flowering branches.
Record Notes: Name checked with The Plant List on 4/29/2013 by Mona Bourell.

1/24/2012 Mona Bourell — Marie McNulty, volunteer working on salvia seed project noticed an ID sign for S. ranzaniana but the only plants she saw tagged were S. miltiorrhiza. Dolores reports that this plant dies back and is not sure if it will come back.

Salvia raymondii — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 5ft. Spread: 2ft.
Flowers Purple
Native Range: Bolivia
Description: This is a short-lived perennial or annual from the cloud-forests of Bolivia. It grows rapidly to 5 ft x 2 ft, and has many small purple flowers. The underside of the foliage is violet-purple in colour, which is often the case with cloud-forest Salvias.
Cultivation: Its hardiness has not been tested, but coming from a high altitude, it may survive outside.
Propagation: It prefers a shady area. Cuttings are not easy to root, but it has produced a few seeds.
Record Notes: Name checked with IPNI, TROPICOS, 12/4/2008.

Salvia recurva — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 6ft. Spread: 4ft.
Flowers Dark purple
Native Range: Mexico - Guatemala
Description: Salvia recurva is a woody-based perennial native to the cloud forests of Central America, limited to the northern slopes of Oaxaca, Chiapas, and Guatemala at elevations around 10,000 feet (3,000 m). It grows where there is year-round warmth and abundant moisture in the air and on the forest floor. Salvia recurva was described by George Bentham in 1848, with the specific epithet referring to the distinct curve in the inflorescence when it first appears.[1]
Salvia recurva grows to 6 feet high and 4 feet wide, and is covered with large ovate leaves that are 6 inches long and wide, with the back of the leaf having pronounced veins. The upper surface of the leaf is purple, along with the petiole, which can reach 6 inches long. Inflorescences reach 1 foot long, with flowers in whorls of 6-12, many of them blooming at once. When the inflorescence begins growing, all that can be seen are tightly packed lime-green calyces, which turn purple as the flower matures. The showy and elegant flowers are dark purple, reaching 2 inches in length, with the upper lip lightly covered in hairs, and the lower lip descending downward. The calyces are large, turning dark purple, along with the stem of the inflorescence.[1]

Salvia ringens — Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers Violet-blue flowers
Native Range: Greece
Description: Salvia ringens is a hardy herbaceous perennial native to the southern and eastern parts of the Balkan Peninsula, with many colonies growing on Mount Olympus, the traditional "home of the gods", at altitudes up to 6,200 feet (1,900 m). Elsewhere, it grows in scrub and coniferous woodland between 1,600 feet (490 m) and 4,200 feet (1,300 m). It was grown in English gardens before 1913, and was described by William Robinson in the twelfth edition of The English Flower Garden in 1933. It dropped from sight before being rediscovered in the late 1990s.[1]
Salvia ringens forms a basal clump of pinnately divided leaves, typically less than 1 foot high and wide. The leaves are dark green with a grayish cast, with petioles and stems that stand out with a wine color. From summer through autumn the plant produces tall (2 foot) flowering stems with two to four flowers at the top, in widely spaced whorls. There are only a few stems at any given time. The 1.5 inch violet-blue flowers are very showy and large, held in a small calyx covered with hair and glands. The specific epithet, ringens, refers to the wide open two-lipped flowers.

Salvia rubescens — Lamiaceae !

INFO
Common Name: Venezuelan red sage
Perennial Herbaceous
Height: 5ft. Spread: 4ft.
Flowers Orange-red
Native Range: Venezuela, Colombia
Description: Purple stems and calyxes so dark that they almost look black contrast dramatically with the deep red-orange flowers of this South American beauty. This tall, spectacular sage has been in cultivation for decades but is still rare in gardens.

The heavily textured leaves are large, growing about 4 inches long and 3 inches wide. They are hairy, which gives the foliage a silvery appearance. The flower spikes grow up to 2 feet tall.

Rubescens refers to the reddish color of the flowers. This native of Venezuela was first described by Reinhard Gustav Paul Kunth in 1817.

Cultivation: This is a robust shrub that requires full sun, average watering and rich, well-drained soil. Plant it in a prominent place so you can enjoy its long bloom throughout fall as well as the hummingbirds who love it. Garden uses include shrub borders, cut-flower gardens, background plantings and patio containers.
Hardy to 25 deg,
USDA Cold Hardiness Zones 9 to 11, may be hardy to Zone 8 winters if treated as an herbaceous perennial and well mulched.
Record Notes: Name checked with The Plant List on 7/30/2013 by Mona Bourell.

Salvia rypara

Lamiaceae !

INFO

Common Name:
Perennial Herbaceous
Height: 2ft. Spread: 2ft.
Flowers Pale lavender
Native Range: Argentina -Bolivia
Description: Salvia rypara is a herbaceous perennial native to Argentina and Bolivia—due to its being very adaptable it is reported to be naturalized in Mexico and possibly Central America. It prefers stream bank habitats, as the specific epithet rypara implies. It also grows in weedy thickets, thriving at elevations under 3,000 feet. Described by John Isaac Briquet in 1896, it is not very well known in horticulture, with only a few gardeners growing it since the 1990s. It is becoming more well known in the United States, France, England, and Italy because it is easy to grow and makes a very attractive garden plant.[1]
Salvia rypara is a small erect plant that grows to 2 feet tall and wide, with many thin stems. The ovate medium-green leaves cover the plant, and grow up to 2-3 inches long and 1.5-2.5 inches wide. The 6-8 inch inflorescences are long and slender, with spaced whorls of 2-12 flowers each, many of them coming into bloom at once. The flowers are a pale lavender, with a flaring lower lip that is just over .5 inch long, and a short erect upper lip.

Salvia sagittata

Lamiaceae !

INFO

Common Name: arrow leaf sage
Perennial Herbaceous
Height: 3-5ft. Spread: 3-5ft.
Flowers Gentian blue
Native Range: Peru-Ecuador
Description: Salvia sagittata (Arrow Leaf Sage) - An evergreen, herbaceous perennial salvia from the Andes (Ecuador, Peru and Chile) at elevations up to 10,500 feet. The Arrow-leaf sage forms a large shrub reaching 3 to 5 feet tall and wide with thick, yellow-green, deltoid shaped leaves. Very distinctive, striking true gentian blue flower spikes occur summer through fall. Quite handsome plant for flower and foliage. Listed for use in herbal remedies, dietary supplements and for yellow dye. This plant made its debut into the California nursery trade in 1999. Sagittata, the specific epithet refers to the sagitate leaf shape, which is latin for arrow-head shaped.
Cultivation: Provide full sun with a quick draining soil. Mulch plants well and water regularly for optimum growth. Not recommended for hot humid climes. Established, well-mulched plants are cold hardy into the 20's.
full sun to part shade

Salvia scabra — Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 3ft.
Flowers pale pink to pale lilac
Native Range: South Africa
Synonomy: Salvia graciliflora Avé-Lall.
Description: Salvia scabra is a herbaceous perennial native to the southeastern strand of the Cape of Good Hope in South Africa, growing on sandy shores, coastal brush, and hilly slopes up to an elevation of 600 feet. It was described and named by Carl Linnaeus in 1781. The leaves and an extract from the roots have been used medicinally in its native region for at least one hundred years. Salvia scabra was introduced to California gardens around 1996, and is extremely adaptable to many types of conditions. Since then it has spread to gardens in England, France, and Italy.[1]

Salvia scabra reaches 3 feet in height in the wild, and about 1.5 feet in cultivation, developing woody stems that are pale brown, round, and covered with short hairs. The leaves are lyre-shaped and lobed, with the lobes becoming more pronounced as the plant matures. The mid-green leaves appear to grow in thick bunches and have a rough surface, which explains the specific epithet scabra. The inflorescences are short, with up to six flower per whorl. The .5 inch flowers are long, straight, and tube-shaped and vary in color from pale pink to pale lilac, with a short hairy calyx that is tinged purple. The calyx expands as the seeds ripen, with the plant producing abundant seed and daughter plants

Salvia sclarea 'Turkestanica' — Lamiaceae ?

INFO
Common Name: white clary sage
Perennial Herbaceous
Height: 3ft.
Flowers White
Description: Large showy silver white flower brachs on stems that grow 3 feet tall. Tall upright stems are square in shape rising from low growing basal foliage. The first year plants produce a large low growing clump of foliage and the second year plants send up the tall flowering stem that is branched. Mostly monocarpic plants that die after setting seeds, remove flowering spikes as soon as they are finished blooming to promote perennialness. Grow in full sun to part shade in well draining soils that are generally moist, lien soils produce sturdier plants with rich soils producing plants that might need staking.

Cultivation: Mostly monocarpic plants that die after setting seeds, remove flowering spikes as soon as they are finished blooming to promote perennialness. Grow in full sun to part shade in well draining soils that are generally moist, lien soils produce sturdier plants with rich soils producing plants that might need staking.
Record Notes: The name is recognized horticulturally as a variety, but does not seem to have been scientifically published. Originally received as Salvia sclarea var. turkestanica, it is being entered as a cultivar name until such time as a valid variety published name is found, 6/12/2008, M. Bourell.

Salvia scutellarioides — Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 1ft.
Flowers Blue
Native Range: Ecuador - Peru
Description: Salvia scutellarioides is an evergreen perennial native to the Andes Mountains in Ecuador, Columbia, and Peru, growing at elevations from 3,300 to 10,000 feet in mild climates where there is year-round moisture. Even though it was described by Carl Sigismund Kunth in 1817, as of 2002 it was still rarely seen in horticulture. The specific epithet is due to its similarity to Scutellaria, a genus in the mint family.

Salvia scutellarioides is evergreen and prostrate, with graceful trailing stems that reach 1.5 feet in length. The forest-green deltoid leaves generously cover the plant, varying in length but averaging about 3.5 inches long and wide. The back surface of the leaf has raised veins, and both surfaces are lightly covered with hairs. Though flowering is sparse, the striking .5 inch flowers are a brilliant blue, with a tiny hairy green calyx. Flowering begins in late summer and continues sporadically through late autumn. The inflorescences are 6-8 inches long, with the flowers growing opposite.[

Salvia semiatrata — Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 6ft. Spread: 3ft.
Flowers Purple Summer, Fall, Winter
Native Range: Mexico: Oaxaca
Description: Intricate bicolored flowers, a lovely blend of lilac colored upper petals and midnight purple lower lips, are held by muted pink calyxes against a foil of handsome, dark green, textured foliage. Perfect for the rocky border or atop a wall where its detail can be enjoyed at eye level. If fault can be found, it is that the plant is brittle. (Digging Dog nursery website) Tends to be evergreen.
Cultivation: Needs fast drainage, loamy garden soil, and good air circulation. At least half day sun in summer and winter. Deep watering at least once each week, and a little lime sprinkled on soil in late spring helpful.
Propagation: by cuttings.
Record Notes: Name checked with The Plant List on 5/19/2014 by Mona Bourell.

Salvia sessei — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 15ft.
Flowers Red Summer
Native Range: Mexico
Description: IN the Wild, Salvia sessei may be found in seven or more provinces in central Mexico. Occurring from 600-7000 ft. its habitat is usually on the edge of woodlands and pine forests. ... A tree-like shrub in the wild, Salvia sessei will reach 15 ft in its native habitat, buit in cultivation it is half that size. Leaves can be variable in size and shape but generally are 2-5 inches long and deltoid in shape. They have a fresh green color throughout the growing season and cover the plant well. The color of the flowers is remarkable blending of soft red and chartreuse that is very beautiful and similar to S. regla. Unfortunetly flowering stems hold up as cut flowers for only a few hours. Susceptible to cold air, S. sessei can be grown outdoors in mild, frost free areas, where it tends to bloom for three months or more. The most floriferous display occurs during summer. [Clebsch 1997]
Cultivation: Full sun and a bed prepared with humus for a moist root-run are needed for this salvia. Good drainage as well as weekly water are necessities too. Growing requirements are simple in a frost-free climate. A popular plant on the French and Italian Riviera, Salvia sessei is often topped to about 4 ft. and encouraged to form a tree-like trunk. ... [Clebsch 1997]
Propagation: Cuttings in August. Rooted cuttings are placed in greenhouse in late October or November to assure plants for the garden the following spring. The production of seed on garden plants is rare. [Clebsch 1997]
Record Notes: Photo is ambiguous.

Salvia sinaloensis — Lamiaceae !

INFO
Common Name: Sinaloa sage
Perennial Shrub
Height: 6-10"ft. Spread: 15-18"ft.
Flowers blue with white spots
Native Range: Mexico
Description:
Salvia sinaloensis (Sinaloa sage) is a perennial native only to the Mexican state of Sinaloa, most often in the foothills of the Sierra Madre Occidental range. It has been available to gardeners since the 1980s. It has many graceful 1 ft. long stems, grows rapidly, and spreads on underground runners into a clump about 1 ft. wide. The flowers are an intense true blue, with the slightest hint of violet, a spot of white on the lower lip, and less than 1 inch long. The wine colored calyx remains long after the flower has dropped its petals
Cultivation: Hardiness: USDA Zones 7-10
Plant Use: Flowering Perennial
Exposure: Sun to Part Sun
Water Requirements: Low

Record Notes: Name checked with The Plant List on 9/13/2011 by Mona Bourell.

Salvia somalensis — Lamiaceae !

INFO
Common Name: Somalia sage
Perennial Shrub
Height: 5ft. Spread: 3ft.
Flowers Pale blue
Native Range: Somalia
Description: Salvia somalensis (Somalia sage) is a perennial shrub endemic to a limited range and elevation in Somalia. It grows at elevations from 4,000 feet (1,200 m) to 7,000 feet (2,100 m), typically in forest clearings or edges as a common or dominant subshrub.
Salvia somalensis is a many stemmed rangy plant that grows up to 5 feet (1.5 m) high and 3 feet (0.91 m) wide. The leaves are oblong and yellow-green, reaching 4 inches (10 cm) long and 1 inch (2.5 cm) wide. The pale wisteria-blue flowers grow in tight, many-flowered whorls, growing on inflorescences that are unusual in that they do not always grow on the terminal ends of stems.

Salvia spathacea 'Powerline Pink' Lamiaceae !

INFO
Common Name: Giant Hummingbird Sage
Perennial Herbaceous
Height: 3ft. Spread: 3ft.
Flowers Pink
Description: This large form of Salvia spathacea comes to us from Rancho Santa Ana Botanical garden. The showy deep maroon-red flowers appear in spring providing a treat for hummingbirds. This selection was made in 1993 by Bert Wilson of Las Pilitas Nursery.Well grown plants tend to bloom again in fall and winter.
Cultivation: Sun, regular water, good drainage.
This salvia is drought tolerant and prefers a situation in full sun, but tolerates garden water well. It is also tolerant of a variety of soils.

Salvia splendens Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 4ft.
Flowers Red
Native Range: Brazil
Description: Salvia splendens (Scarlet Sage, Tropical Sage) is a tender herbaceous perennial that is native to Brazil, growing at 2,000 to 3,000 m (6,600 to 9,800 ft) elevation where it is warm year-round and with high humidity. The native plant, rarely seen in cultivation, reaches 1.3 m (4.3 ft) tall. Smaller selections are very popular as bedding plants, seen in shopping malls and public gardens all over the world.

Salvia splendens 'Vanhoutii' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft. Spread: 4ft.
Flowers Burgandy Jul, Aug, Sept, Oct
Description: This showy Salvia makes a dazzling container plant. The large, layered, burgundy buds have pointed sepals and open into numerous dark carmine-colored flowers with wine-red calyxes. Intriguing raised red ridges run horizontally around the stems at regular intervals like rungs on a ladder, connecting the reddish leaf petioles of each pair of opposite leaves.

Cultivation: Be sure to provide winter protection, as Salvia vanhoutii is hardy only in warmer climates.
Record Notes: Name checked with The Plant List on 9/6/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.
Originally in records as 'Salvia vanhouttii'.

Salvia sprucei — Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 12ft. Spread: 6ft.
Flowers Pink Spring, Summer
Native Range: Ecuador
Synonomy: S. theresae Briq.
Description: Pink winter flowering.
Salvia sprucei is a herbaceous perennial in the Lamiaceae family that is native to Ecuador, growing at 7,000 feet (2,100 m) elevation or higher in thick scrub on steep slopes. It was named in 1898 by botanist John Isaac Briquet for the British plant collector Richard Spruce. It is likely that Spruce discovered the plant on a collecting trip in Ecuador in 1857.

Salvia sprucei is a many-branched plant that reaches up to 12 feet (3.7 m) high and 6 feet (1.8 m) wide. The leaves are ovate and vary in size, growing up to 3.5 inches (8.9 cm) long and 1.5 inches (3.8 cm) wide. The top of the leaf is green with a yellow undertone, while the underside has white veining that is covered with hairs. The watermelon pink flowers are 1.5 inches (3.8 cm) long, with the upper lip hooded and covered in fine hairs. The calyces are yellow-green and quite long, reaching .75 inches (1.9 cm). The loosely held whorls of flowers grow on branched inflorescences.[

Cultivation: Spring-summer bloomer; best in filtered light; good under story plant; needs weekly watering
Fast growing. Frost tender. Suitable for hot, humid areas.
Record Notes: Name checked with The Plant List on 9/6/2011 by Mona Bourell.

Salvia squalens 'Orange Form' — Lamiaceae !

INFO
Common Name: sticky Peruvian sage
Perennial Shrub
Height: 2-3ft. Spread: 2ft.
Flowers Orange/red
Description: Salvia squalens 'Orange Form'

(Orange Sticky Peruvian Sage) Tropical in look and feel, this handsome Sage from Peru has large almost round heavily wrinkled leave that are aromatic and sticky to the touch. Once they grow to a foot tall they begin to bloom, and the flowers are stunning. Large bright orange/red with a prominent bee line, these never fail to attract attention.

Grow this in a container where you can enjoy its beauty close-up. In mild climates or in a greenhouse, this flowers for us almost year-round.

Cultivation: Exposure Partial shade
Soil type Well drained & rich
Water needs Average

Salvia subrotunda — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-5ft.
Flowers Red
Native Range: Brazil-Argentina
Description: Blooming from Spring till Frost this delightful and rare Salvia species was collected from the Iguassa Falls region of Brazil and Argentina several years ago. Its seeds have since been passed around by hummingbird enthusiast as it's not only an attractive sage but a great hummingbird favorite! Growing 3'-5' tall and busy in form, this all-season-bloomer bears vivid scarlet flowers on long upright green stems held above the attractive bright green heart-shaped leaves. Perennial here in 9b, but it also self-sows, so you'll get fresh new lovelies every year.
Similar to Salvia coccinea, the seeds are very easy to plant and germinate. Unlike Salvia coccinea, Salvia subrotunda is much taller and its flowers are shaped differently than Salvia coccinea.
Record Notes: Name checked with The Plant List on 9/6/2011 by Mona Bourell.

Taxon Family Spelling Checked

Salvia taraxacifolia — Lamiaceae !

INFO
Common Name: dandelion leaf sage
Perennial Herbaceous
Flowers Pink
Native Range: Morocco
Description: A herbaceous perennial shrub that is native only to southwest Morocco, growing in the Atlas Mountains at elevations ranging from 2,000 feet (610 m) to 8,000 feet (2,400 m). Very adaptable, it grows on limestone slopes, forest clearings, and rocky riversides. It has no close allies in the genus Salvia. The specific epithet, taraxacifolia, is likely Persian in origin and means 'leaves shaped like a dandelion'.

Salvia taraxacifolia has lyre-shaped grey-green leaves that remain on the plant year round, with leaves growing up to 4 inches (10 cm) long in thick basal rosettes. The underside is covered with hairs, giving it a whitish color. Glands on the hairs give off a pleasant citrus aroma when brushed. Pinkish-green flowers grow on stalks reaching up to 8 inches (20 cm) tall, growing in whorls spaced about 1 inch (2.5 cm) apart on the inflorescence. Plants spread into large mats, with many flower stalks blooming at once.[

Salvia tiliifolia — Lamiaceae !

INFO
Common Name:
Annual Herbaceous
Height: 3ft. Spread: 3ft.
Flowers Blue March
Native Range: Mexico
Synonomy: S. tiliaefolia, Salvia fimbriata Kunth
Description: Widespread throughout Mexico, Central and Southern America, this species has blue flowers, which are some of the smallest of the genus. This is perhaps a plant for collectors only, as it is rather weedy. Growth is 3ft. x 3ft. Close inspection will show a plant which is quite attractive. The combination of lime-green leaves, black stems, and black calyces from which the tiny flowers can just be seen might appeal to some people. The plant is annual, and can seed itself around a large area, rather like a similar species, S. misella.
Record Notes: Name checked with IPNI and TROPICOS, 3/7/2008.

Salvia tubiflora — Lamiaceae !

INFO
Common Name: tubular Chilean sage
Perennial Shrub
Height: 8ft. Spread: 4ft.
Native Range: Peru, Chile
Description: (Tubular Chilean Sage) Foggy days and moderate temperatures are the norm for this low-altitude, coastal mountain sage from northern Chile and Peru. It is grown as much for its handsome foliage as for the deep cranberry of its tiny, tubular flowers.

In the wild Salvia tubiflora can grow up to 9 feet tall in partial shade to full sun. However, in our coastal California gardens it averages 5 feet tall and wide. Add an extra foot to that height when it is in bloom in fall.

This is a handsome sub-shrub that combines mostly soft herbaceous growth with a bit of shrubby wood. The deeply veined leaves are bright green, up to 4 inches long, and shaped like elongated hearts. The flowers are accented by reddish bracts.

In general, this sage handles winter conditions well in USDA Zones 9 to 11. Our Tubular Chilean Sage begins blooming in late September and continues until the onset of inclement weather. It is a fine container plant and also is pretty in shrubby borders. Although this aromatic plant only requires average watering based on local conditions, it is a good choice for moist areas of the yard.

Cultivation: Hardy to 20 deg.
Full sun

Taxon | Family Spelling Checked

Salvia verbenaca — Lamiaceae !

INFO
Common Name: verbena sage
Perennial
Native Range: Europe
Description: Salvia verbenaca, also known as wild clary or wild sage, is native to the British Isles, the Mediterranean region in Southern Europe, North Africa, and Near East, and in the Caucasus. It can be found as an introduced species that has naturalized in meadows in the Eastern United States.
S. verbenaca is a tall perennial herb with hairy stems and branches that erectly sprawl out. Its leaves are basal and toothed that vary from 3 to 10 cm (1.2 to 3.9 in) long. It has soft purple to violet flowers in mid summer. It is in flower from June to September, and the seeds ripen from July to October. The flowers are bisexual and are pollinated by bees. Some are also cleistogamous and pollinate themselves.
The plant is noted for attracting pollinators and wildlife. It prefers neutral and alkaline soils and needs full sun. This aromatic sage is used as a flavoring in foods and to make tea; the flowers can be added to salads.

Cultivation: Full sun to part shade, well drained soil, cold hardy.
Record Notes: Name checked with The Plant List on 6/30/2014 by Mona Bourell. Name originally in the record misspelled as Salvia verbenacea.

Salvia viridis — Lamiaceae !

INFO
Common Name: annual clary sage
Annual Herbaceous
Height: 1-2ft. Spread: 1ft.
Synonomy: salvia horminum
Description: Horminum Sage is a hardy annual native to the Mediterranean region. It was grown in Britian as an ornamental in the sixteenth century and illustrated by John Gerard in 1633.

Horminum Sage grows one to two feet with a neat, tuft-like crown of sage-like leaves and a striking top-knot of colorful bracts in delicate hues of pink, blue, and purple. Sow seed in a sunny site in early spring for flowers in summer. It is useful in the flower border or as an edging plant.
An annual plant native to an area extending from the Mediterranean to the Crimea and into Iran. It was known as Salvia horminum for many years, since Carl Linnaeus described S. viridis and S. horminum as separate species in 1753. Some modern botanist still believe that they are two separate species. viridis, from the Greek, refers to the color green, with implications of youth and vigor. horminum is Greek for sage.
Salvia viridis quickly grows to 1 to 2 feet (0.30 to 0.61 m) tall and 1 foot (0.30 m) wide, with a flowering period of over a month. Colorful bracts almost hide the tiny two-lipped flowers, which are cream-colored, with the upper lip tinged with purple or rose, reflecting the bract color. The flowers last well as cut flowers or dried flowers. Seed can be sown in late March in a greenhouse or directly into the border after the last frost.
In A Modern Herbal, M. Grieve and C. F. Lyel write that the seeds and leaves of Salvia viridis used to be added to fermenting vats to "greatly increase the inebriating quality of the liquor". An infusion of the leaves was used for sore gums, and powdered leaves for snuff. It was also reported to be a good honey-producing plant.
Cultivation: Prefers friable soil, good drainage, moderate water, and three-quarters to a full day of sunlight.
Record Notes: Name checked with The Plant List on 4/16/2012 by Mona Bourell.
Originally received as S. horminum which is a synonym.

Taxon Family Spelling Checked

Salvia wagneriana Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 6-10ft. Spread: 6-10ft.
Flowers Rose pink Mar
Native Range: Mexico: Chiapas - Central America
Cultivation: Given enough water and sunlight Salvia wagneriana gets quite large. If it is kept on a rather spartan diet Salvia wagneriana should be 6 feet tall and wide. It loves heat and blooms nonstop until the frost sets it back. It is damaged at 25 F or so but will recover from dips into the low 20's.
It will bloom in light shade near the coast and in dry situations but really prefers the moisture, heat and light.
Record Notes: Name checked with The Plant List on 10/19/2011 by Mona Bourell.

Flowers Red march
Native Range: Mexico?
Description: An unusual wild hybrid discovered by Frank Almeda. Probably large gorwing. Bloomed in pot with small off-red flowers in 2003. [Don Mahoney]

ACCESSION **SFBG# 2004-0652** Rec'd: 8/15/2004
Source: Mexico via Frank Almeda via Betsy Clebsch
Orig. Qty: 1
Material: 1 gallon
Intended for use in: Dry Mexico

Wild Collected by Larry Kelly (NYBG), Frank Almeda(CAS), et al. 1316; 12 January 2003 Mexico Mexico. Oaxaca: 25 km SW of San Jeronimo Coatlan, toward San Gabriel Mixtepec, elev. 1622 m. Oak-pine forest on decomposing granite; steep east facing slope in canyon. Shrub to 1.5 m tall. Corolla red, fading to pink; calyx green in some plants but purple-black in others..

LOCATION
Bed 14A - Mesoamerican Cloud Forest Qty:1 Pl:12/3/2004 Ckd:3/14/2013 Marc Johnson and Patrick Quinn
Middle of S side of bed, slightly interior from grass path; Plant appears to be 2 plants, but is one plant, that was "split" in half when a large tree limb from the Pittosporum fell on it.

Notes
3/14/2013 Marc Johnson — Plant appears to be 2 plants, but is one plant, that was "split" in half when a large tree limb from the Pittosporum fell on it.

9/24/2004 Tony Morosco — Recieved replay from Frank Almeda "Tony, I just got a reply from my colleague in New York with the information about locality for that Salvia you asked about some time ago. It is as follows:" ... locality information (copied to wild table) followed.

9/13/2004 Tony Morosco — From Frank Almeda: "Hi Tony, I checked my photos and notes for that Salvia you wrote about. The collection number is Kelly et al. 1316 (voucher will come eventually to CAS). Two sets of our specimens are extant. It appears most of the others were lost in the mail if we can believe what they tell us from Mexico. The Mexican mail has to be the worst and most corrupt I have

9/8/2004 Tony Morosco — Notify gardener: Gary W. when tagged and ready to pant.

9/8/2004 Tony Morosco — Location of plants not noted on accession form.

9/8/2004 Tony Morosco — email sent to Frank Almeda asking for details on wild collection

Salvia x silvestris 'Snowhill' — Lamiaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 1.5-2ft. Spread: 1-1.5ft.
Flowers White
Synonomy: Salvia x superba 'Snow Hill'
Description: This salvia cultivar is a compact plant which typically grows only to 20" tall. Features densely-flowered, spike-like racemes of pure white flowers which bloom in June and continue throughout the summer. Flowers are attractive to bees and butterflies. This plant is a mint family member which has narrow, dark green, basal leaves (to 5") and smaller stem leaves. This cultivar is a sport of Salvia x sylvestris 'Blue Hill' . Also sometimes listed and sold by nurseries as Salvia x superba 'Snow Hill'.
Provides long summer bloom to the perennial border, rock garden, cottage garden, wild garden or naturalized planting.
Cultivation: Easily grown in average, dry to medium, well-drained soil in full sun. Tolerates drought. Prefers moist soils with cool nights. May become somewhat floppy in humid summer conditions. Removing spent flower spikes helps extend bloom period.
Sun: Full sun
Water: Dry to medium
Maintenance: Low

Record Notes: Name checked with Missouri Botanical Garden Kempfer Center, 10/21/2009.

Salvia x superba 'Rose Queen' — Lamiaceae !

INFO
Common Name:
Perennial
Flowers Rose
Synonomy: S. nemerosa 'Superba'
Description: This hybrid of S. nemorosa and S. sylvestris is a drought-tolerant perennial that lends vivid purple-blue hues to the garden from summer to early fall on 1.5- to 3-foot-tall spikes. Deadheading prolongs bloom. The spikes rise from a clump of silvery green leaves that grows to about 2 feet tall and wide.
Plant Form:
Tight foliage rosette, spreads by rhizomes
Flower / Fruit:
¼ to ½ in. rose colored flowers on 3-6 in. erect, branching stems; blooms summer thru fall
Leaves: Wrinkled, dull green, finely toothed, oval or lance-shaped.
Lower leaves 4-in.-long, upper ones smaller.
Cultivation: Sunset Zones: 2-10, 14-24
Soil: Well-drained
Water: Low to regular
Sun: Full sun, heat tolerant
Care and Pruning:
Deadhead to encourage bloom
Cut to basal growth in winter
GARDEN USE: Perennial borders, cut flower gardens. Attracts hummingbirds
Record Notes: Cultivar name found used in the trade with internet search, 7/27/2010.

Salvia x westerae — Lamiaceae !

INFO
Common Name: hybrid Bolivian sage
Perennial Shrub
Height: 3-5ft. Spread: 4ft.
Flowers Dark pink
Parentage: S. orbignaei x S. haenkei
Description: This naturally occurring hybrid is a Bolivian native related to S. orbignaei and S. haenkei. Prettier than its parents, it has large, profuse, long-blooming flowers that are dark pink.

Hybrid Bolivian Sage is erect and symmetrical when young with dark green foliage. Its lance-like leaves are 3 to 4 inches long. This plant tends to sprawl as it grows. One good way to display it is planted at the base of another sage for support, such as Salvia x 'Big Swing' or Salvia darcyi.

An ideal container plant, it also looks attractive as a groundcover or in a perennial border.
Goes dormant in winter.

Cultivation: Sun Requirements: Full Sun to Partial Shade
Minimum cold hardiness: Zone 9a -6.7 °C (20 °F) to -3.9 ° C (25 °F)
Maximum recommended zone: Zone 11

Record Notes: Name checked with The Plant List on 7/30/2013 by Mona Bourell.

Sambucus mexicana See: Sambucus canadensis ! — Adoxaceae

INFO
Common Name: blue elderberry, elderberry, Mexican Elder
Perennial Tree
Height: 15-30ft. Spread: 25-35ft.
Flowers White Spring
Native Range: Southwestern North America
Synonomy: Sambucus canadensis L. [accepted name]; Sambucus nigra subsp. canadensis (L.) Bolli

Not Invasive
Description: Elderberry is a semi-evergreen small tree, reaching up to 30 feet in height (Fig. 1). Most opengrown specimens do not reach this height as they grow wider than tall. The light green, thick, leathery, pinnately compound leaves are often browsed by deer and livestock. The four to eight-inch-wide, flat cymes of yellow/white blooms appear mainly from April to June but in its native habitat may also occur at various times throughout the year after heavy rains. The small, blue/black fruits which follow the blooms are quite popular with birds and can be used to make wine or pies, and were reportedly even dried by Indians to be used at a later time. Fruits appear white because they are covered with a thick, waxy coating. A dye can be made from the stems and has been used to color baskets.
Cultivation: The plant prefers light (sandy), medium (loamy) and heavy (clay) soils. The plant prefers acid, neutral and basic (alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It requires moist soil. The plant can tolerates strong winds but not maritime exposure. It can tolerate atmospheric pollution.
Roots: surface roots are usually not a problem
Winter interest: tree has winter interest due to unusual form, nice persistent fruits, showy winter trunk, or winter flowers
Outstanding tree: tree has outstanding ornamental features and could be planted more
Invasive potential: little, if any, potential at this time
Ozone sensitivity: sensitive or moderately tolerant
Verticillium wilt susceptibility: susceptible
Pest resistance: no pests are normally seen on the tree
Propagation: Cuttings of half-ripe wood, seeds sown in fall

Sambucus nigra 'Guincho Purple' Adoxaceae !

INFO
Common Name: purple European elderberry
Perennial Shrub, Tree
Height: 8-15ft. Spread: 8-15ft.
Flowers White June - July
Potentially Invasive
Description: Dark green leaves maturing to chocolate purple then turning to red in the fall. Corymbs of pink flowers on purple stems develop into purple-black fruits. Grows to 15 feet tal by 10 feet wide.
Cultivation: Train early to single or multiple trunks. USDA Zones 5 to 8. Full sun to part shade, Regular watering.
Record Notes: Scientific Name checked in IPNI, cultivar name in common use per Google search 6/21/2005. Sambucus nigra is known to be somewhat invasive at SFBG from self-sown seed, thus this cultivar may be as well.

Sambucus racemosa var. racemosa Adoxaceae !

INFO

Common Name: Red Elderberry
Perennial Tree
Native Range: North America, Circumboreal
Synonomy: Sambucus microbotrys, Sambucus pubens, Sambucus pubens var. arborescens, Sambucus callicarpa, Sambucus racemosa var. leucocarpa, Sambucus racemosa ssp. pubens, Sambucus racemosa var. arborescens, Sambucus racemosa var. microbotrys, Sambucus racemosa var. pubens
Description: NATIVE
Plant 1–6 m.
Leaf: leaflets 5–7, 4–16 cm, lanceolate to oblong-ovate, base generally asymmetric, tip ± acuminate. Leaf: abaxially glabrous or stiff-hairy, especially on veins.
Inflorescence: generally 6–12 cm diam., ± dome-shaped; central axis generally dominant.
Flower: petals often reflexed.
Fruit: red

Samolus repens — Primulaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers White
Native Range: Australia, New Zealand
Description: A small herb from the coastal saltmarsh. The creeping stems grow to 20cm high. Leaves at the bottom of the stem are larger than those further up the stem. Each stem carries a single white flower with five petals. The flowers are about 10mm across.

Flowering: Spring to summer, but a few flowers at other times

Habitat: Saltmarsh and mangrove swamps.
Distribution: Along the coast from northern NSW down to South Australia, and Tasmania.

Record Notes: Name checked with IPNI, 8/26/2008.

Sanguisorba officinalis Rosaceae !

INFO
Common Name: great burnet
Perennial Herbaceous
Height: 3ft.
Flowers Purple, red, pink or white
Native Range: N Hemisphere
Description: Herbs perennial, 30–120 cm tall. Rootstock brown or purple-brown, robust, usually fusiform, rarely terete, cross section yellow-white or purple. Stems erect, angular, glabrous, or base pilose or sparsely glandular hairy. Radical leaves: stipules brown, membranous, glabrous or abaxially sparsely glandular hairy; petiole long, glabrous or sparsely glandular, base sheathing and imbricate, sometimes sparsely glandular hairy; leaf blade with 4–6 pairs of leaflets; leaflets petiolulate, green on both surfaces, ovate, oblong-ovate, fasciated oblong, or fasciated lanceolate, 1–7 × 0.5–3 cm, base cordate to broadly cuneate, margin coarsely obtusely or rarely acutely serrate, both surfaces glabrous or abaxially sparsely pilose; cauline leaves: stipules large, semiovate, herbaceous, margin acutely serrate; leaflets shortly petiolulate or sessile, oblong to oblong-lanceolate, base subcordate to rounded, apex acute. Inflorescences erect, spicate, ellipsoid, cylindric, or ovoid, usually 1–6 × 0.5–1 cm, flowering from apex to base; rachis glabrous or occasionally sparsely glandular hairy; bracts lanceolate, shorter than or nearly equaling sepals, membranous, abaxially pilose, apex acuminate to caudate. Sepals 4, purple, red, pink, or white, elliptic to broadly ovate, abaxially pilose, with faint longitudinal midvein, usually with shortly acute apex. Stamens 4; filaments filiform, 0.5–1 × as long as sepals, exserted beyond them or not. Ovary glabrous or puberulous; stigma dilated, discoid, margin fimbriate-papillate. Fruiting hypanthium longitudinally 4-ribbed. Fl. and fr. Jul–Nov.

Thinned forests, forest margins, thickets, meadows, grasslands, grassy mountain slopes, damp places in ravines, stream banks; near sea level to 3000 m. Taxon Family Spelling Checked

Sanicula crassicaulis Apiaceae !

INFO
Common Name: Pacific sanicle, Pacific black snakeroot
Perennial Herbaceous
Flowers White
Native Range: Baja Calif - Brit. Columbia
Invasive
Description: Plant 24–120 cm, stout, taprooted
Leaf generally simple, palmately lobed, green; blade 3–12 cm, generally ± rounded-cordate, lobes 3–5, obovate, generally ± deeply cut, margins finely sharply serrate, teeth generally ± 1 mm, central lobe often > 10 mm wide at base, its ultimate segment 4–20 mm wide
Inflorescence: peduncle 0.7–8 cm; bracts ± 5, 1–2 mm, narrowly lanceolate, < heads; pedicels short
Flowers: bisexual 3–8; staminate 3–5; calyx lobes 0.5–0.7 mm, ± lanceolate, acute, fused at base; corolla yellow; styles 2 X calyx lobes
Fruit 2–5 mm, nearly round, sometimes clearly stalked, with stout, curved prickles throughout or these little developed below, all bulbous-based
Seed: face grooved
Chromosomes: 2n=32,48,64
Ecology: Open slopes, ravines, woodlands
Elevation: 0–1000 m.
Bioregional distribution: Northwestern California, Central Western California, Southwestern California, Sierra Nevada Foothills
Distribution outside California: to British Columbia, Baja California; s S.America
Highly variable
Cultivation: Information from the Jepson Horticultural Database for Sanicula crassicaulis

Given excellent drainage (modification of compacted or other water-holding soils may be necessary), grows especially well in zones 6 and 17 and also in zones 4 and 5.

Given excellent drainage (modification of compacted or other water-holding soils may be necessary) and full or part shade (morning and winter sun may be tolerated), grows in zones 7, 14, 15, 16, 18, 19, 20, 21, 22, 23, and 24.

Invasive; once established, tending to outcompete, displace, or overrun others.

Santolina 'Little Nicky' Asteraceae !

INFO
Common Name:
Perennial Herbaceous
Height: .5ft. Spread: 1ft.
Flowers Yellow
Description: Dave Fross of Native Son Nursery in California brought back this amazing miniature-leaf santolina from a trip to Europe. S. 'Little Nicky' resembles an ancient dwarf conifer, forming a tight mound of very aromatic, congested, grey-green growth, eventually reaching 10" wide x 6" tall...superb for rock gardens and miniature railroads. Reportedly, S. 'Little Nicky' does produce the same yellow flowers as the species, but our plants have never thought about flowering. As with all santolinas, good drainage in the summer is very important.
Record Notes: Spelling checked in Google search 5/9/2006.

Santolina chamaecyparissus ssp. tomentosa Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 0.75ft.
Flowers Yellow
Native Range: Mediterranean
Description: Softer yellow colored flowers and shorter than the normal species. With silver-gray colored, compact foliage.. More or less evergreen shrubby plants with balls of yellow flowers, growing 8 inches tall. An attractive formal looking plant.

Cultivation: Very drought tolerant, grow in full sun in well draining soils, in zone 9 will take some shade. Rich and moist soils can cause plants to over grow and flop - trim back in late spring

Zones 6-9

Propagation: Surface sow the seeds and use 40-60F with germination spread-out over many months. Keep moist but use well draining medium and do not water log. Keep seed trays for 2 years to make sure all the seeds germinate.
Record Notes: Name checked with Tropicos on 8/9/2011 by Mona Bourell.

Sapindus mukorossi — Sapindaceae !

INFO
Common Name: soapnut
Perennial Tree
Flowers Red, not significant
Native Range: China
Synonomy: Sapindus saponaria L. , Sapindus detergens Roxb.
Description: A deciduous tree up to 20 m tall. Leaves pinnate, 15-35 cm long, glab¬rous; leaflets sub-sessile, 4-8 pairs, opposite to sub-opposite, lanceolate to oblong, 6-15 cm long, 3-5 cm broad, entire, acute to acuminate, oblique. Flowers sub-sessile, greenish-yellow in terminal, pubescent panicles; pedicel up to 4 mm in fruit; bract 1 mm long, subulate, margin glandular. Sepals unequal, c. 2 mm long, elliptic-oblong to ovate, margin ciliate, glandular at the tip. Petals 5, 3 mm long, lanceolate-ovate, clawed, ciliate, with 2 woolly scales on the claw. Disc 5-ridged, glabrous. Stamens 8, free; filament c. 3 mm long, lower half pubescent; anthers 0.5 mm long, oblong, non-functional in the female. Ovary sessile, 2-4 mm long, obovate, 3-locular, glabrous, rudimentary in the male flower; stigma 3-lobed. Berry globose, 1.5-2.5 cm long, hard or coriaceous when dry, yellowish-brown, 1-seeded, 2 undeveloped cocci at the base. Seed 1.4 cm in diameter, black to dark brown.

Fl. Per.: May -June.

Type: Probably described from Japan.

Distribution: Indigenous to China; cultivated in Japan, S. W. India, Bengal and W. Pakistan.

The 'soap-nut' tree is cultivated for its fruit, the pericarp of which is saponaceous and used for washing clothes and hair. It also makes a good roadside tree.
Cultivation:

Record Notes: Considered a synonym of Sapindus saponaria Linnaeus, Sp. Pl. 1: 367. 1753., in Flora of China. 1/27/2011.

Synonomy: Sarcococca pruniformis Lindl.
Description: Shrubs or small trees, up to 3 m tall; young branches longitudinally ribbed, pubescent. Petiole slender, 6-8 mm; leaf blade lanceolate, oblanceolate, elliptic-lanceolate, oblong-lanceolate, or narrowly lanceolate, rarely elliptic or elliptic-oblong, (3-)5-8(-11) × (0.7-)1.3-1.8(-3) cm, deep green adaxially, puberulent along midrib, base attenuate, apex acuminate or acute; midrib impressed or plane adaxially, elevated abaxially, lateral veins pinnate, obscure on both surfaces. Inflorescences racemes, ca. 1 cm; rachis puberulent; bracts ovate or ovate-lanceolate, apex subulate-apiculate, puberulent abaxially. Male flowers 5-8, inserted in apical part of rachis, shortly pedicellate or sessile, ebracteolate or 2 bracteoles on basal flowers; tepals 4, inner tepals broadly elliptic or suborbicular, 3 -3.5 mm, outer tepals shorter, puberulent abaxially. Female flowers 1 or 2, inserted on base of rachis, flower and pedicel 6-7 mm; bracteoles several, ovate, imbricate; tepals similar to bracteoles, ca. 2 mm. Fruit globose, capsule black or blue-black; persistent styles 2 or 3, ca. 2 mm, erect, apices recurved.

Native habitat: Forests; 1000-3500 m. Chongqing, W Hubei, S Shaanxi, Sichuan, E Xizang, Yunnan [Afghanistan, Bhutan, NE India, Nepal].

Record Notes: Name checked with Tropicos on 7/23/2014 by Mona Bourell. The Plant List has it as a synonym of Sarcococca pruniformis Lindl.

Sarcococca hookeriana var. humilis Buxaceae !

INFO
Common Name: Sweet Box
Perennial Shrub
Height: 1-2ft. Spread: 2-3ft.
Native Range: China
Description: Hardiness Zones: 7 to 9
Habit: Evergreen
Growth Rate: Slow to moderate
Size: Height 12 to 24 inches
Form: Loose; informal
Texture: Medium
Foliage: Lustrous dark green leaves
Flower/Fruit: Cluster of fragrant white flowers in later winter to early spring; .4 inch round black fruit
Comments: Useful in groups as filler or background; spreads by underground stems
Cultivation: Partial shade to shade; prefers organically enriched, well-drained acidic soil
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

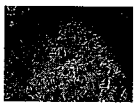
Sarcococca saligna Buxaceae !

INFO
Common Name: Willow Leaf Sweet Box
Perennial Shrub
Height: 4ft. Spread: 8ft.
Flowers white Dec, Jan,
Native Range: Himalayas
Synonomy: Buxus saligna D. Don; Sarcococca pruniformis Lindl.; Sarcococca pruniformis var. angustifolia Lindl. ; Sarcococca salicifolia Baill.



Description: Shrubs, 3-5 m tall; rhizome ramified from base; young branches light green, longitudinally ribbed, glabrous. Petiole slender, 5-8 mm; leaf blade lanceolate or oblong-lanceolate, usually 6-8 × 1.2-2 cm, papery, deep green adaxially, lucid, light green abaxially, densely and very minutely punctate, base cuneate, apex long acuminate, obtuse, or slightly mucronate at tip; midrib elevated on both surfaces, lateral veins pinnate, basal a subtriplinerved pair, distance 6-8 mm from base. Inflorescences short racemes, erect, ca. 1 cm; rachis pubescent. Flowers light yellow. Male flowers 5 or 6, inserted apically; pedicels short; bracteoles 2, or apical part ebracteolate; tepals long ovate, ca. 3 mm, acute. Female flowers 2 or 3, inserted basally; bracteoles several, ovate, densely imbricate, acute; tepals similar to bracteoles in shape. Fruit globose or subellipsoid, ca. 6 mm in diam., darkly purple when mature; persistent styles 3, ca. 1.5 mm, apices recurved; carpopodium 4-5 mm. Fl. Sep-Dec.
Evergreen forests; 1200-2300 m. Taiwan, S Xizang (Gyirong, Nyalam) [Afghanistan, India, Nepal, Pakistan].

image of © 2004 Tony Morosco, SFBG1985-0200

image of © 2004 Tony Morosco, SFBG1985-0200

Genus of about 14 species of monoecious, evergreen, sometimes rhizomatous shrubs found in moist, shady places, forest, and thickers from china to Himalayas and S.E. Asia. Sarcococca is a foliage evergreen plant. Little flowers are not attractive.
Cultivation: Grow in moist, well-drained soil in deep or partial shade. Full sun is tolerated if the soil remains moist.
Propagation: Take semi-ripe stem cuttings. Sow seed in containers in autumn or spring.
Record Notes: Name checked with Tropicos on 4/17/2013 by Mona Bourell. The Plant List has it as a synonym for S. pruniformis.

Sargentodoxa cuneata Sargentodoxaceae !

INFO
Common Name:
Perennial
Native Range: China
Description: Bark with longitudinal fissures. Stems with red sap, cross section with radiated markings; branches red-brown to brown, subterete. Winter buds with many imbricate scales; scales scarious, outer ones ovate, inner ones oblong-ovate. Leaves (1 or)3-foliolate; petiole 5–10 cm, slender, channeled; leaflets unequal; lateral leaflets subsessile, subdeltoid, extremely asymmetric with inner basal angle narrowly cuneate and outer basal angle truncate to oblique ovate, usually slightly larger than terminal one; terminal leaflet petiolules 5–10 mm; blade rhomboid-ovate, 4–14 × 3–cm, base cuneate, apex acute. Inflorescences solitary, many-flowered, loose racemes, pendulous, 8–15 cm. Flowers fragrant, yellow to yellowish green. Pedicels 1--1.5 cm, with 1 oblong bract at base; bracteoles 2, at middle of pedicel, alternate, awl-shaped. Male flowers: sepals imbricate in bud, ± erect to spreading, narrowly oblong, 6–10 × 2–4 mm, margin slightly revolute. Petals rhomboid-orbicular, ca. 1.2 mm. Sta-mens ca. 4 mm; filaments 1–1.5 mm; anthers oblong. Female flowers: receptacle subglobose to oblong, ca. 1.4 × 1.2 cm. Fruit 20–40, dull blue, berrylike, stipitate, 7–10 mm in diam. Seeds blackish, ovoid, ca. 5 mm. Fl. Mar–Jul, fr. Jun–Oct.

Open forests on mountain slopes or in gullies; 400–1600(--2000) m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Henan, Hubei, Hunan, Jiangsu, Jiangxi, S Shaanxi, Sichuan, SE Yunnan, Zhejiang [Laos, N Vietnam].

The stems and roots are used medicinally.

Taxon Family Spelling Checked

Saruma henryi — Aristolochiaceae !

INFO
Common Name: upright wild ginger
Perennial Shrub
Flowers Yellow to Yellow-Green Apr, May, Jun, Jul
Native Range: China
Description: Natural habitat: Dense forests, valleys, stream banks; 600-1000 m. Gansu, Guizhou, Hubei, Jiangxi, Shaanxi, Sichuan.

Rhizomes robust, ca. 5 mm in diam. Stems 0.5-1 m tall, gray-brown pubescent. Petiole 3-12 cm, pubescent; leaf blade cordate, 6-15 × 5-13 cm, both surfaces pubescent, base cordate, apex shortly acuminate. Pedicel 2-3.5 cm, pubescent. Calyx lobes ca. 10 × 7 mm. Petals yellow or yellow-green, cordate-reniform, clawed, ca. 10 × 8 mm. Stamens overtopping ovary; filaments ca. 2 mm; anthers oblong, with connectives slightly extended beyond anthers. Style absent; stigma decurrent along ventral surface of carpel. Fruit follicular, 6-8 × 4-6 mm. Seeds deltoid-obconic, ca. 3 mm, densely transversely rugose. Fl. Apr-Jul.

Saruma is unusual in having what appears to be well-differentiated sepals (3) and petals (3); all other Aristolochiaceae have one perianth whorl of three parts, which are considered to be sepals by convention (Cronquist, 1987). The petals of Saruma are hypothesized, based on studies of floral development, to be derived from stamens, providing a testable hypothesis for the origin of these petals. In contrast, the petals of many angiosperms are considered to be developmentally homologous with sepals. Thus, the inclusion of species with petals apparently homologous to either sepals or stamens allows testing of critical hypotheses on the origin of petals. Saruma henryi has a moderate-sized genome (3136 Mbp).

Sasaella masamuneana 'Albostriata' — Poaceae !

INFO
Common Name:
Perennial Graminoid
Height: 6ft.
Synonomy: Arundinaria masamuneana (Makino) Murata for species
Cultivation: like many other groundcover bamboos, benefits from mowing to the ground early each spring. Annual mowing is especially important with this bamboo to rejuvenate the stunning variegation, as it tends to grow more green foliage during the summer and more variegated foliage in the spring. This bamboo is vigorous and should be contained, unless rampant spreading is your desire. It is popular for its vigor and medium height

Record Notes: Cultivar name found used in the trade with internet search; also called Arundaria masamuneana; 6/8/2009

Sassafras randaiense — Lauraceae !

INFO
Common Name: Taiwanese Sassafras
Perennial Tree
Native Range: Taiwan
Synonomy: Lindera randaiensis
Description: Deciduous medium-sized trees, up to 70 cm d.b.h. Bark dark brown, longitudinally fissured. Branchlets robust, glabrous, red-brown when dry, lenticellate, with dense semilunar leaf scars. Leaves alternate, those on infertile branchlets unlobed or 2- or 3-lobed, those on fertile branchlets unlobed; petiole ca. 4 cm; leaf blade glaucous abaxially, green adaxially, rhombic-ovate, 10-15(-16) × 3-6(-7.5) cm, lateral veins 7 or 8 pairs, midrib conspicuous on both surfaces, basal lateral veins subparallel to leaf margin, arising from midrib at ca. 40°, base broadly cuneate, apex acute. Raceme terminal or subterminal, appearing before leaves, ca. 3 cm, pedunculate, 5 or 6 in umbel at apex of branchlet, each subtended by involucral bracts at base; involucral bracts 3 or 4, orbicular, ca. 1.5 cm, pubescent outside, late deciduous; bracts filiform-linear, ca. 1 cm, barbate. Pedicel ca. 6 mm. Perianth tube short, puberulent outside; perianth lobes 6, lanceolate-linear, subequal, ca. 4 × 1.25 mm, sparsely puberulent outside, glabrous inside. Fertile stamens 9, in 3 series, subequal; filaments complanate, those of 3rd whorl each with 2 sessile glands at base; anthers ovoid-oblong, cells of 1st whorl 3, upper cell infertile, or 2, all fertile, those of 2nd and 3rd whorl 2. Staminodes of innermost whorl triangular-cordate or stamenlike, stipitate. Ovary obovoid, ca. 1 mm; style short, ca. 1 mm; stigma discoid. Fruit globose, ca. 6 mm in diam., seated on shallow perianth cup; stalk 2.5-3 cm, glabrous, gradually dilated toward apex.
Native habitat: Evergreen broad-leaved forests; 900 -2400 m. C and S Taiwan (Ali Shan).

Satureja douglasii — Lamiaceae !

INFO

Common Name: yerba buena
Perennial Groundcover
Flowers White
Native Range: Western North America
Synonomy: Thymus douglasii, Micromeria douglasii, Clinopodium douglasii
Description: A very low, trailing herb found growing in shady places under shrubs and trees from Los Angeles Co. to British Columbia. Makes a pretty groundcover in the shade garden and is also nice spilling over a wall or container. It will take sunny sites with plenty of water, but generally looks better in the shade. Tiny white flowers will bloom from April to September. The shiny green leaves make an excellent soothing tea.

Record Notes: Name checked with Tropicos, and Jepson Manual on 9/10/2013 by Mona Bourell.

Taxon Family Spelling Checked

Satureja mimuloides see: Clinopodium mimuloiedes !
Lamiaceae

INFO
Common Name: monkey-flower savory
Perennial Shrub
Flowers Salmon
Native Range: North America
Synonomy: = syn of Clinopodium mimuloiedes
Description: Perennial to subshrub, erect, < 2 m
Stem nonwoody, except sometimes at base; hairs long, ± spreading
Leaf 35–80 mm, 15–55 mm wide, ± ovate to triangular, shallowly and irregularly crenate-dentate; hairs appressed, white
Inflorescence: flowers 1–6 per leaf axil; pedicels 2–3 cm
Flower: calyx 14–17 mm, tubular-bell-shaped, veins purple, lobes 3–5 mm; corolla 15–35 mm, salmon, often faded when dry
Fruit ± 2 mm, brown, surface smooth
Ecology: Moist places, streambanks, chaparral, woodland
Elevation: 400–1800 m.
Bioregional distribution: Central Coast, Outer South Coast Ranges, Transverse Ranges

Cultivation: Information from the Jepson Horticultural Database for Satureja mimuloides:

Given excellent drainage (modification of compacted or other water-holding soils may be necessary) and moderate summer watering, grows especially well in zones 5, 7, 8, 9, 14, 15, 16, 17, 19, 20, 21, 22, 23, and 24 and also in zones 6, 10, and 18.

Record Notes: Name checked with The Plant List on 9/10/2012 by Mona Bourell, and found to be a synonym of Clinopodium mimuloiedes (Benth.) Kuntze.

Saurauia kegeliana Actinidiaceae !

INFO

Common Name:
Perennial Tree/shrub
Native Range: Mex: Chiapas - Honduras
Synonomy: Saurauia zahlbruckneri Buscal.; Saurauia pauciserrata f. veranii Buscal.; Saurauia pauciserrata var. longeliana Buscal.; Saurauia pauciserrata f. kegeliana (Schltdl.) Buscal.; Saurauia pauciserrata var. kegeliana (Schltdl.) Buscal.; Saurauia pauciserrata var. crenata Buscal.; Saurauia pauciserrata Hemsl.; Saurauia maxonii Donn. Sm.; Saurauia intermedia Buscal.
Description: From Flora Mesoamerica:

Trees or shrubs, (1.5-)6-12 m; branchlets glabrous or sparsely tufted pubescent, grey brown to light brown. Leaf blades 7-17 × 3-6 cm, obovate (occasionally elliptic), chartaceous, adaxially dark brown-green, abaxially green to brown-green, the secondary veins 6-13 pairs, the tertiary veins no more prominent than higher-order venation, adaxially glabrous to sparsely strigose along the first and second order veins, abaxially glabrous to sparsely strigose, usually villous in the axils of the secondary veins, the base acute, the margins serrulate or serrate, the apex acuminate; petioles 1.5-7 cm × 1-2 mm, glabrous or sparsely tufted pubescent. Inflorescences 1.5-6.5 × 2-6 cm, with 4-15(-23) flowers; peduncle 4-9 cm, glabrous to sparsely tufted pubescent; pedicels (3-)5-10 mm, sparsely tufted or stellate pubescent. Flowers 1.5-2 cm in diameter; buds 4-8 mm in diameter. Sepals 5, 5-9 × 3.5-7 mm, broadly ovate, adaxially densely stellate to minutely sericeous near apex or glabrous, abaxially with the imbricate surfaces densely stellate pubescent (sometimes also with tufted hairs) and the exposed surfaces nearly glabrous, or nearly glabrous throughout. Petals 5, 7-10 × 4-9 mm, oblanceolate to obovate. Stamens 22-34, the filaments 2-3.5 mm, the anthers 2.5-3.5 mm. Ovary 5-locular, glabrous, the styles 5, 3.5-5 mm. Fruits 1-1.5 cm in diameter, glabrous. Cloud forests, montane rain forests, Quercus-Pinus forests. Ch (Matuda 2975, NY); ES (Standley 21563, MO); G (Broome 731, MO); N (Bunting y Licht 351, NY). 1400-2400 m. (Endémica.)

Taxon Family Spelling Checked

Saurauia madrensis Actinidiaceae !

INFO

Common Name: moquillo
Perennial Tree
Height: 40ft.
Flowers White Summer - Fall
Native Range: Mexico: Chiapas
Description: 1900-3000m,
Gorgeous red and green foliage on a magnificent tree up to 40'with white blooms. This cloudforest resident is grown for its amazing, large, lush, dark green leaves covered with red fuzz, with especially nice silky violet iridescent hairs on the new growth. It looks a lot like a giant, hairy bronze loquat. It grows as an upright to gawky. It is a relative of kiwifruit (Actinidia deliciosa) and the small, furry fruit are intensely sweet and edible. It wants part shade to shade, rich, moist soil with infrequent to regular watering, not too much wind, and protection from hard freezes. It is at its best in the fog belt. It does well in containers but must be watered conscientiously. Throw it into your foliage garden almost anywhere and it will improve the look, just make sure to give it enough room. It will quickly get large enough to spread up and over the top of smaller plants.
Fruits edible and delicious.

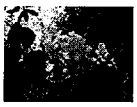

Image of © 2010 David Kruse-Pickler, SFBG1984

From Flora MesoAmerica;
Trees or shrubs, 2-12 m; branchlets densely plumulose-hirsute, dark brown to rusty brown. Leaf blades 10-25(-33) × 5.5-10 cm, oblong to elliptic, coriaceous, adaxially brown to greenish brown, abaxially light brown to light green, secondary veins 17-28 pairs, tertiary veins raised, more prominent than higher-order venation, adaxially sparsely hirtellous, abaxially densely stellate and plumulose-hirsute, floccose in the axils of the secondary veins and sometimes along midvein, the base obtuse to rounded (and often oblique), the margins serrate, the apex acute; petioles 2.5-7 cm × 2.5-3 mm, densely plumulose-hirsute. Inflorescences (3.5-)6-14 × 3-7 cm, with 20-60 flowers; peduncle 3.5-11 cm, plumulose-hirsute; pedicels 3-8 mm, plumulose-hirsute. Flowers 1.8-2.5 cm in diameter; buds 4-5 mm in diameter. Sepals 5, 5-6 × 3-6 mm, elliptic to rotund, adaxially glabrous, abaxially with the imbricate surfaces glabrous, the exposed surfaces plumulose hirtellous and sometimes minutely stellate. Petals 5, 8-11

Taxon Family Spelling Checked

Saurauia montana — Actinidiaceae !

INFO

Common Name: snot tree
Perennial Tree
Native Range: Central America
Description: Saurauia montana is a tropical tree found in Honduras, Costa Rica, and Panama.
Common name: snot tree
A small tree 3 to 10 m.
Habitat: Common in open areas up to 1550 m.
Leaves: 8 x 30 cm, obovate (widest above middle), spiraled, margin with sharp teeth, rough-pubescent.
Flowers: dioecious, 5 to 12 flowers on inflorescence, each 2-cm flower has 5 white petals
And many orange stamens attached in a ring, the woolly ovary has 5 styles present in female flowers, absent in males.
Fruit: soft, pubescent, green capsule to 2 cm, opening with 5 valves to expose tiny brown seeds embedded in a slimy jelly-like matrix.

One often finds slime and seeds dripping from the open fruits (thus the common name).

From Flora Mesoamerica:
Shrubs 2-3 m or trees 3-8(-10) m; branchlets setose, hirsute, or strigose (sometimes plumulose) and densely stellate or without stellate trichomes, dark brown, light brown, or reddish brown.
Leaf blades 8-32 × (2.5-)6-14 cm, broadly or narrowly elliptic to obovate, coriaceous or chartaceous, adaxially dark brown, abaxially brownish green or light brown, the secondary veins 14-24(-42) pairs, the tertiary veins raised, more prominent than higher-order venation, adaxially hirsute, setose, or strigose (densely so along midvein), abaxially sparsely to densely hirsute or strigose (midvein with same pubescence as branchlets), usually also sparsely to densely stellate (sometimes without stellate trichomes), usually villous in the axils of the secondary veins, the base acute, obtuse, or rounded, the margins setaceo-serrulate or -serrate, the apex acute to acuminate; petioles 0.9-5 cm × 2-4 mm, setose, hirsute, or strigose (sometimes plumulose) and densely stellate or without stellate trichomes.
Inflorescences 3-11(-18) x 2.5-8 cm, with 7-30

Saurauia zahlbruckneri

Actinidiaceae !

INFO

Common Name: butterscotch tree
Perennial Shrub/Tree
Flowers White
Native Range: Guatemala, Mex: Chiapas
Description: The mucilaginous pulp of ripe fruits taste like Butterscotch!

Medium sized shrub native to South American cloud forests. Bears a 1" purple-green skinned fruit related to the kiwi, with a strongly sweet flavor. The huge leaves are hairy, and very ornamental, making the tree an attractive garden addition. This species is similar to S. madrensis in appearance. Hardy to the 20's, this plant does particularly well in cooler climates.

From Flora MesoAmerica:
Trees or shrubs, 2-10 m; branchlets strigose, dark brown. Leaf blades (7-)13-21 × (3-)5-7 cm, elliptic to obovate, coriaceous, adaxially shiny green-brown or dark brown, abaxially dull light green-brown or light brown, the secondary veins 12-20 pairs, the tertiary veins raised, more prominent than higher-order venation, adaxially sparsely strigose along the primary and secondary veins, glabrous on the intercostal regions, abaxially sparsely strigose along the primary and secondary veins, glabrous on the intercostal regions, usually woolly villous barbate in the axils of the secondary veins, the base acute to rounded, the margins serrate-setose, the apex acute to obtuse; petioles 1.5-2.8 cm × 1.5-2 mm, moderately strigose. Inflorescences 13-21 × 4.5-7 cm, with 20-60 flowers; peduncle 6-12 cm, strigose and minutely stellate; pedicels 2-9 mm, densely villous. Flowers 1.2-1.5 cm in diameter; buds 4-6 mm in diameter. Sepals 5, 3-6 × 2-5 mm, oblong to orbicular, adaxially glabrous, abaxially with the imbricate surfaces glabrate to minutely stellate, the exposed surfaces moderately tufted and minutely stellate. Petals 5, 5-7 × 4-5 mm, oblong to obovate. Stamens 30-40, the filaments c. 2 mm, the anthers ca. 2 mm. Ovary 5-locular, glabrous, the styles 5, 4-5 mm. Fruits 8-10 mm in diameter, glabrous. Cloud forests, montane rain forests. Ch (Breedlove 38820, MO); G (Croat 41373, MO). 1300-1500 m. (Endémica.)

Saxifraga rotundifolia — Saxifragaceae !

INFO
Common Name: roundleaf saxifrage
Perennial Herbaceous
Flowers White to white with pink spots
Native Range: Greece, Turkey
Description: Perennial with basal leaf-rosette and erect leafy stem to 40cm.
Leaves orbicular, thin, cordate, coarsely dentate, basal ones with long petiole.
Flowers in loose panicle.
Petals white with red spots, 6-11mm.
Ovary superior.

Cultivation: For any humus rich, rather moist soil in partial shade. Good ground covering plant.
Record Notes: Name checked with IPNI, 9/14/2010.

Taxon | Family Spelling Checked

Saxifraga stolonifera — Saxifragaceae !

INFO
Common Name: creeping saxifrage
Perennial Herbaceous
Height: 0.5-1.5ft. Spread: 1-2ft.
Flowers White May, Jun
Native Range: China, Japan
Synonomy: Saxifraga sarmentosa, S. stolonifera Meerb., Saxifraga
Description: Although commonly called strawberry begonia or strawberry geranium (plants spread by strawberry-like runners and have begonia/geranium-like leaves), this is neither a begonia nor a geranium. It is an evergreen, stoloniferous, mat-forming perennial of the Saxifrage family that is native to rocky cliff areas in China and Japan. It is classified in the irregulars (diptera) section of the genus. If grown in the garden, it should be sited in a shady area. Plants form rosettes of long-stalked leaves that will typically rise to 8" tall and spread somewhat rapidly by thin, thread-like stolons to 24" wide. Rounded, dark green leaves (to 4" wide) have silver veining on top and pink-red undersides. From late spring to early summer, flower stems rise well-above the foliage to 18" tall bearing loose, airy panicles of asymmetrical white flowers (1" wide), each flower having two large lower petals and 3-4 smaller upper petals. Saxifrage comes from the Latin words for rock (saxum) and break (frangere) in reference the plant's ability to scramble over rocky areas. Stolonifera means having stolons. Another common name for this plant is mother of thousands in reference to the plantlets that form at the stolon tips.

Cultivation: Where winter hardy, it should be planted in moist, organically rich, light, well-drained soils in part shade to full shade. Indoors, plants should be sited in bright indirect light, although some direct sun (if not intense) will promote the best reddish leaf colors.

Where winter hardy, this plant forms an excellent ground cover for shady areas. Mass in shade or woodland gardens. Also may be planted near streams, ponds or fountains. Where not winter hardy, grow in containers or hanging baskets. Plants may also be grown indoors in windows or hanging baskets as houseplants (baby plantlets that form at the ends of the thin drooping stolons are ornamentally attractive).

Saxifraga x urbium 'London Pride' — Saxifragaceae !

INFO

Common Name:
Perennial Herbaceous
Height: 0.5ft.
Flowers Pink
Parentage: S. umbrosa x S. spathularis
Description: London Pride is tolerant of dry, shady conditions. It grows to a height of 15–30 cm (6–12 inches) and provides rapid ground cover without being aggressively invasive, and in late spring produces a mass of small pale pink rosette flowers growing from succulent stems. It will grow well in neglected or unfavourable urban spaces where few other flowers flourish, and is a common garden escapee. In particular, tradition holds that it rapidly colonised the bombed sites left by the London Blitz of the early 1940s. As such it is symbolic of the resilience of London and ordinary Londoners, and of the futility of seeking to bomb them into submission.
Record Notes: Name found to be used in the trade with internet search, 1/6/2010.

Scadoxus multiflorus Alliaceae !

INFO
Common Name:
Perennial Geophyte
Native Range: South Africa
Synonomy: Haemanthus
Description: Closely related to Haemanthus, but with thinner leaves with a midrib, a corm or tuber instead of a bulb, and found occurring mainly in the summer rainfall area in the wild (as opposed to winter rainfall for Haemanthus). At one time the two genera were treated as one.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Scadoxus multiflorus ssp. katharinae Alliaceae !

INFO
Common Name:
Perennial Geophyte
Flowers pinkish-orange-red with yellow anthers
Native Range: South Africa
Synonomy: Haemanthus katharinae
Description: perennial-Geophyte- Ht 0.75 - 1.2 m.in states: EC, KN, MP, SWZ
Scadoxus multiflorus ssp katharinae is an evergreen rhizomatous perennial, producing up to nine leaves per season whose tubular leaf bases form a pseudostem, a false stem formed by the sheathing leaf bases which overlap closely and are pressed flat against each other. The pseudostem is sturdy and fleshy with a diameter of up to 25 mm, and is usually purple spotted but can be plain and almost white.

The leaves are large and thin-textured with a distinct midrib and an undulating margin. They encircle the pseudostem giving a single plant an overall symmetric shape. The leaves of a well-grown plant can stand up to 70 cm high with a spread of up to 110 cm.

The spectacular flowerhead is a huge spherical umbel consisting of up to 200 flowers, held clear of the foliage at the end of a solitary stem. Each plant will produce only one flowerhead in a season. A flowerhead can reach a diameter of 25 cm and a height of 110 cm, nearly waist height. Each flower is pinkish-orange-red with protruding stamens carrying bright yellow anthers. The flowerheads last for 1 or 2 weeks and make superb cut flowers. Flowering is in late summer to early autumn (December-March). The seed develops in the inferior ovary which is visible as a swelling of the flower stalk below the flower, at the tip of the pedicel. These will swell to form a green berry that will turn scarlet as it ripens during winter-spring (South Africa: July - September). These decorative berries can remain on the plant for up to 2 months.

Record Notes: Orignally received as Haemanthus katharinae which according to the African Flowering Plants Database is a synonym, 10/5/2010.

Scaevola aemula 'White Fan' Goodeniaceae !

INFO
Common Name: Outback Fan Flower
Annual - Perennial Herbaceous
Height: 1ft. Spread: 2-3ft.
Flowers White Spring - Fall
Native Range: Australia
Description: has non-stop flowers, attractive foliage, and better branching than other Scaevola. This new series tolerates a wide range of conditions and endures stress without leaf loss. They have an open, prostrate habit. This White Fan Flower is a knockout with it's beautiful white flowers. It is immune to extremes in temperatures and conditions. They are stunning in combos or alone.

Schefflera bodinieri — Araliaceae !

INFO
Common Name:
Perennial Shrub/tree
Native Range: China, Vietnam
Synonomy: Heptapleurum bodinieri H. Léveillé; Agalma lutchuense Nakai; A. octophyllum (Loureiro) Seemann; Aralia octophylla Loureiro; Eleutherococcus bodinieri H. Léveillé; Schefflera compacta Frodin ex Lauener.
Description: Shrubs or small trees, to 12 m tall, andromonoecious. Petiole 3.5-25 cm; petiolules 0.4-5 (-6) cm; leaflets 5-9(-11), ovate-lanceolate to oblong-lanceolate or linear-lanceolate, rarely ovate to elliptic, 8 -12(-18) × 1-4.5(-5.5) cm, membranous or papery, abaxially glabrous or sparsely minutely stellate pubescent, adaxially glabrous, secondary veins ca. 10 pairs, inconspicuous to slightly raised on both surfaces, base cuneate or broadly cuneate to rounded, margin entire or usually sparsely to moderately serrulate, apex acuminate to caudate-acuminate, sometimes falcate. Inflorescence a terminal panicle of umbels, gray or brown pubescent; primary axis 4-16(-20) cm, secondary axes 1.5-7 cm, with a terminal umbel of bisexual flowers and sometimes 1(or 2) lateral umbels of male flowers; pedicels 4-7 mm at anthesis, to 8 mm in fruit. Calyx sparsely gray-white stellate pubescent. Ovary 5-carpellate; styles united into a column, ca. 1 mm. Fruit subglobose to ellipsoid or ovoid, 4-7 × 4-6 mm; styles persistent, minutely capitate, to 1.5-3.5 mm. Fl. Oct-Nov, fr. Feb, Apr.
Dense forests on slopes or in valleys; 400-1000 m. Guangxi, Guizhou, W Hubei, Sichuan, Yunnan [Vietnam].

Taxon Family Spelling Checked

Schefflera delavayi Araliaceae !

INFO
Common Name:
Perennial Tree
Native Range: China
Synonomy: Heptapleurum delavayi Franchet; Agalma delavayi (Franchet) Hutchinson; A. discolor (Merrill) Hutchinson; H. dunnianum H. Léveillé; Schefflera delavayi var. ochrascens Handel-Mazzetti; S. discolor Merrill; S. megalobotrya Harms
Description: Trees, to 8 m tall, hermaphroditic. Petiole (10-)15-60 cm; petiolules 1-15 cm; leaflets (4 or)5, elliptic to ovate-oblong or ovate-lanceolate, 8-30(-35) × 3-12 cm, papery to leathery, abaxially densely gray-white or yellow-brown stellate tomentose, adaxially glabrous, secondary veins 7-13 pairs, tertiary veins indistinct, base acute to obtuse or rounded, margin entire to sparsely and irregularly dentate (incised or usually pinnately lobed in young plants), apex abruptly acute to acuminate. Inflorescence terminal, a panicle of spikes, gray-white tomentose; primary axis 25-80 cm; secondary axes to ca. 30 cm. Flowers sessile. Calyx tomentose, distinctly 5-toothed. Ovary 5-carpellate; styles united into a column. Fruit globose, 3.5-4 mm in diam., 5-ribbed when dry; styles ca. 2 mm; pedicels to ca. 1 mm. Fl. Oct-Nov, fr. Jan. 2n = 48.

Evergreen broad-leaved forests, wet forest margins, and as scattered trees in valleys or on stream banks; 600 -3000 m. Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Sichuan, Yunnan [Vietnam].

This species is used medicinally.

Cultivation: The species is cold tolerant to at least minus 4 degrees Celsius over a period of 2 months.
This Schefflera species prefers partial shading. It originates from lime stone mountains in evergreen, monsoon forests of South-West China. It is a highly recommended horticulture species.

Schefflera fengii Araliaceae !

INFO
Common Name:
Perennial Tree
Height: 20-25ft.
Native Range: China: Yunnan
Description: Trees, to 15 m tall, probably andromonoecious. Petiole 6-30 cm; petiolules 1-6 cm; leaflets 5-7, oblong or elliptic to slightly obovate, 10-21 (-27) × 3-9(-16) cm, leathery, abaxially densely yellow-brown stellate tomentose, epidermis obscured, adaxially sparsely stellate pubescent on veins or glabrous, secondary veins 8-12 pairs, tertiary veins slightly raised abaxially, distinctly impressed adaxially in dry material, base acute to nearly rounded, margin entire or with 1-4 small teeth apically, apex acuminate. Inflorescence a terminal panicle of umbels, densely light brown to ferruginous stellate pubescent, then sparsely so and grayish; primary axis to 15(-25) cm; secondary axes to ca. 20 cm; pedicels 2-3 mm at anthesis, expanding to 8 mm in fruit. Calyx inconspicuously 5-toothed, sparsely stellate pubescent. Ovary (4 or)5-carpellate; styles united into a column. Fruit globose, 3 -4 mm in diam., 5-ribbed when dry, sparsely stellate pubescent to glabrous; styles persistent, 1.5-2 mm. Fl. Aug, fr. Oct-Nov.
Native habitat: Mixed forests on dry mountain slopes; 1800-2500 m. C and SE Yunnan.
Cultivation: May need some cold protection but seems to be reasonably hardy.
Record Notes: Name checked with The Plant List on 9/27/2014 by Mona Bourell.

Schima argentea Theaceae !

INFO
Common Name:
Perennial Tree
Flowers White
Native Range: Myanmar, China, Vietnam
Synonomy: Schima bambusifolia Hu; S. mairei Hochreutiner
Description: Trees 6-15 m tall. Young branches brown, glabrous, with white lenticels; current year branchlets silvery appressed sericeous; terminal buds silvery sericeous. Petiole 1-1.5 cm, sparsely pubescent or glabrescent; leaf blade thinly oblong to lanceolate, (6.5-)8-14 × 2-5 cm, leathery, abaxially glaucous and sparsely pubescent or glabrescent, adaxially green and shiny and glabrous, secondary veins ca. 10 on each side of midvein, slender, and visible to slightly raised on both surfaces, base cuneate, margin entire, apex acuminate to long acuminate. Flowers solitary or 3-8 arranged in a corymbose raceme. Pedicel 1-2(-3.5) cm, slender, recurved, appressed silvery sericeous; bracteoles 2, caducous, ovate, 5-7 mm. Sepals orbicular, 2-3 × 2-3 mm, outside brown and glabrous except basally sericeous, inside white sericeous, margin ciliolate. Petals white, broadly obovate, 1.5-1.8 × 1-1.5 cm, outside basally white sericeous, apex rounded. Stamens 8-10 mm; filaments basally adnate with petals. Ovary white tomentose but apically glabrous; style ca. 7 mm, glabrous; stigma 5, capitate. Capsule globose, 1-1.5 cm in diam.; pericarp woody, splitting into 5 valves, white lenticellate. Seeds together with wing 6-9 × 4-4.5 mm. Fl. Jul-Sep, fr. Dec.
Forests; 1600-2800(-3200) m. S Guangxi, Jiangxi, SW Sichuan, Yunnan [Myanmar, Vietnam].

Schima wallichii Theaceae !

INFO
Common Name: Needlewood, Laukya (Burma), Chilauni (India), Mang-tan (Thailand), Medang Gatal (Malaysia), Chinese guger tree (Taiwan).
Perennial Tree
Height: 100ft.
Flowers White Spring
Native Range: Himalayas - SE Asia
Description: Large evergreen tree up to 100 ft (35 m) height and 3 ft (1 m) DBH with a dense crown and straight trunk. White 1-2 inch flowers in spring. Bark dark grey or almost black, becoming very thick and deeply cracked. Inner bark dark red, fibrous and irritating. Leaves variable, 2-8 x 5-18 cm, broadly ovate, mostly without teeth. Above dark glossy green, without hairs, below light green with short white hairs at the veins. Young leaves orange, densily covered with silky hairs. Flower 2 – 5 cm, white, solitary or clustered in the axils of leaves near the end of the twigs, flowering March – April. Fruit 1 – 2.5 cm woody spherical capsule splitting into 5 sections with many seeds surrounded by a narrow wing, fruiting November – February.

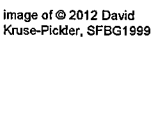

image of © 2012 David Kruse-Pickler, SFBG1999

Wood durable; main house building timber used for poles, beams and boards by many ethnic groups in Xishuangbanna. Good fuelwood, used by Aini and produced in a coppice system with standards. The species is fire-resistant and can be planted in fire breaks. Can be propagated through seedlings and by direct sowing. [http://natureproducts.net/Ecology/Apel1.html]

Schisandra propinqua ssp. intermedia — Schisandraceae !

INFO
Common Name:
Perennial Vine/Liana
Flowers Cream, yellow, orange, pink, or purplish Oct
Native Range: India, Myanmar, Thailand, China: Yunnan
Description: Monoecioua woody vine.
Flora of China species description: Plants glabrous throughout. Young branches lacking wings; leaf-bearing branches elongated. Petiole 0.4-2.7 cm; leaf blade elliptic to ovate, (5-)7-11.5(-20) × 1-4(-8.5) cm, papery to leathery, not glaucous, secondary veins (4 or)5 or 6 (-9) on each side of midvein, base cuneate, broadly cuneate, or truncate, margin entire, subentire, denticulate-serrulate, or rarely serrate, apex shortly acuminate Flowers axillary to fugacious bracts at base of young shoots or axillary to leaves, solitary or rarely with secondary flower in axil of prophyll; peduncle 2-17 mm (staminate), 3-14 mm (pistillate). Tepals 7-17, cream, yellow, orange, pink, or purplish, largest 3-12.5 × 2.5-10 mm. Staminate flowers: stamens 10-16, connate into an androecial mass 2.6-2.8 mm in diam.; anthers on conspicuous connectives; pollen 6-colpate. Pistillate flowers: tepals 9-12, largest 6-11 × 5.5-6.5 mm; carpels 18-52; pseudostyle flat and subulate. Fruit peduncle 7-12 mm; torus 2-6.5 cm; apocarps red to purple, 4.5-9 × 4-8.5 mm. Seed testa ± smooth. Fl [in China] . May-Jul, fr. Sep.
Native habitat: Mixed forests, open scrub; (800-)1100 -2100 m. China: Yunnan [NE India, E Myanmar, N Thailand].

Record Notes: Name checked with Flora of China, 11/5/2009.

Schizanthus candidus — Solanaceae !

INFO
Common Name: Poor Man's Orchid
Annual Herbaceous
Height: 2-3ft.
Flowers White
Native Range: Chile
Description: The 1" - 1.5" pure white blooms looking like flying white egrets when viewed from the side, are born in mass on upright, very multi-branching stems Summer thru Fall at least. (Ours continued blooming all thru Winter). Easily, a hundred blooms at a time form a shimmering cloud above the attractive ferny foliage. 24" to 30" tall & across, plant it in a pot for maximum viewing pleasure. Fast & easy, rich soil is best. Rare!! Reseeds!
Record Notes: Plant name found with IPNI search, 5/11/2006. M. Bourell.

Schizophragma integrifolium — Hydrangeaceae X

INFO
Common Name:
Perennial
Native Range: China
Synonymy: Schizophragma denticulatum
Description: Shrubs scandent. Branchlets brown, glabrous. Petiole 2-9 cm, glabrous; leaf blade abaxially green or glaucous, adaxially glossy green, elliptic, narrowly so, or broadly ovate, 8-20 × 3.5-12.5 cm, thickly or thinly papery, abaxially glabrous or sometimes sparsely pubescent along veins or barbate at vein axils, adaxially glabrous, secondary veins 7-9 on both sides of midvein, base broadly cuneate, rounded, or shallowly cordate, margin entire or serrulate, apex acute to acuminate. Inflorescences corymbose, densely appressed brown pubescent, glabrescent. Sterile flowers with expanded sepal 1(-3), yellow-white, ovate-lanceolate, lanceolate, or broadly elliptic, 3-7 × 2-3 cm in fruit. Fertile flowers with calyx tube turbinate, 1.5-2 × 1-1.5 mm, base subacute; teeth triangular, ca. 0.5 mm. Petals narrowly ovate, 2-3 mm, apex obtuse. Stamens subequal, 4.5-6 mm at anthesis; anthers subglobose, ca. 0.5 mm. Style and stigma ca. 1 mm. Capsule campanulate to turbinate, 6-8 × 3.5-4.5 mm, base broadly cuneate, projected apical part shortly conical, ca. 1.5 mm. Seeds brown, compressed, 3-4 mm including wings; wings 1-1.5 mm. Fl. Jun-Jul, fr. Oct-Nov.

Leaf blade abaxially green, thick

* Dense to sparse forests in valleys or on mountain slopes or summits; 200-2000 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Yunnan, Zhejiang.

Taxon Family Spelling Checked

Schoenoplectus acutus — Cyperaceae !

INFO
Common Name: tule, Common Tule, Viscid bulrush, western common tule, Hard-Stemmed Tule
Perennial Aquatic graminoid
Native Range: North America
Synonomy: Scirpus acutus Muhl. ex Bigelow; Schoenoplectus lacustris subsp. acutus (Muhl. ex Bigelow) A.Löve & D.Löve
Description: Rhizomes 5–15 mm diam. Culms cylindric, 1–4 m × 2–10 mm. Leaves 3–4, all basal; sheaths often dark reddish proximally, front membranous-translucent and splitting, orifice adaxially deeply V-shaped; blades 1–2, C-shaped to dorsiventrally flat in cross section, usually much shorter than sheath, distal blade 8–120 × 3–7 mm, margins often scabridulous. Inflorescences 2 (–3) times branched, open or compact, branches 6(–18) cm; proximal bract usually erect, thickly C-shaped in cross section, 1–9 cm, margins sometimes scabridulous. Spikelets 3–190, solitary or in clusters of 2–8, never all solitary; scales reddish to orange-brown to straw-colored, often variable on same scale, usually wholly or partly straw-colored and prominently lineolate-spotted at 10X, scale or midrib often green when young, ovate, 3–4 × 2–3 mm, sparsely to often densely reddish or straw-colored spinulose-papillose distally or on most of surface, margins ciliate, hairs long, contorted, flanks veinless, apex acute to obtuse, notch 0.3–0.5 mm deep, awn on at least some scales in spikelet usually strongly contorted, 0.5–2 mm (often broken off). Flowers: perianth members (4–)6(–8), brown, bristlelike, equaling achene body or sometimes much shorter, rarely rudimentary, spinulose; anthers 2 mm; styles 2(–3)-fid. Achenes dark gray-brown, plano-convex or rarely weakly trigonous, obovoid, (1.5–)2–3 ´ 1.2–1.7 mm; beak 0.2–0.4 mm.

Varieties 2 (2 in the flora): North America, Mexico, possibly Eurasia, e Pacific Islands.

Plants of Schoenoplectus acutus var. occidentalis that have most styles 3-fid, most achenes trigonous, and culms very soft with large air cavities occur at lower elevations in California (mostly southern) and Baja California. In California they often grow on stream bars. They may deserve varietal status. The varieties intergrade throughout most of the west with var. occidentalis

Native Range: South Africa
Description: A handsome, medium to large tree with a wide-spreading, densely branched, rounded crown. It has a single trunk that sometimes branches low down. Trees can reach a height of 22 m, but most commonly grow 11 to 16 m with a spread of 10 to 15 m. The bark is rough and brown or grey brown. The leaves are compound, with 4 to 6 pairs of leaflets, each with an entire, wavy margin. The foliage is reddish to coppery when young, turning bright green and maturing to a glossy dark green. In warm frost-free areas this tree is evergreen, but in colder regions it is deciduous, losing its leaves for a short period in winter to spring.
Record Notes: Name checked in IPNI 11/29/2005.

Sciadopitys verticillata Sciadopityaceae !

INFO
Common Name: Japanese Umbrella Pine
Perennial Tree
Height: 60-90ft.
Native Range: Japan
Synonomy: Taxus verticillata Thunb
Description: An evergreen tree to 20-30(35) m tall and up to 1 m dbh, with dense, heavy branching and luxuriant foliage, single- or multi-stemmed. Bark thick soft red-brown, stringy. Shoots orange-brown, glabrous, dimorphic (long or short); buds ovoid, 3-4 mm, only produced at the shoot apices. Leaves of two types, scale leaves on the stem, brown, 1-3 mm, widely spaced between the nodes on long shoots, and clustered in a tight spiral pseudowhorl subtending the photosynthetic leaves at the apex of both long and short shoots. Photosynthetic leaves variously interpreted as a pair of true leaves fused together, or as highly modified shoots (cladodes); linear, in pseudowhorls of 10-30 at the shoot nodes, 6-13 cm long, 2-3 mm wide, 1 mm thick, heavy, fleshy, pliable, with a prominent mid-line groove on both sides; rich glossy green with a pale stomatal line each side of the mid-line groove on the underside; persistent 3-4 years. Pollen cones 6-12 mm, in dense terminal clusters 1-2 cm across. Seed cones subsessile, ovoid, green ripening dark brown in 18-20 months from pollination, 4.5-10 cm long, 3.5-6.5 cm wide when open; fragile and breaking up soon after seed release. Fertile scales 15-40 per cone, thin, flat to upcurved, 2-3 cm long, 2-3.5 cm wide, rough, matt, with a broad flap-like transverse bract lateral across most of the width of the scale at its widest point; apex rounded, irregularly waved. Seeds 5-9 per scale, orange-brown, 8-12 mm long, flattened ovoid with a narrow wing along each side of the seed and notched at the apex. Cotyledons 2.

image of © 2012 Mona Bourell, SFBG2004-0563

from FOC:
Trees to 40 m tall; trunk to 3 m d.b.h.; branches ± whorled, spreading at ca. 90° to trunk. Scalelike leaves triangular, 3-6 mm; connate leaves linear, 8-12 × 2.5-3 mm, with 2 white stomatal bands along middle furrow abaxially. Pollen cones ovoid, ca. 1.2 cm, shortly stipitate. Seed cones narrowly ovoid, 8-12 × ca. 2.5 cm; cone scales broadly cuneate or fan-shaped, margin thin, reflexed, apex broadly rounded; bracts with triangular, recurved, free apex. Seeds oblong or elliptic

Scirpus nodosa — Cyperaceae X

INFO
Common Name: Knobby Club Rush
Perennial Graminoid
Native Range: Australia
Synonomy: Isolepsis nodosa?
Description: This fast growing perennial plant forms clumps with upright often arching, dark green stems. Brownish, globular flower heads are produced through the year. Grows to a height of 0.5-1.5m and a width of 0.6-2m. Habitat: A tough, hardy, Australian native plant which thrives in full sun in a range of soils. Tolerates salty spray, waterlogged and saline soils.

Uses: Ideal for planting around pond margins. Adds texture and colour to seaside gardens and water features, useful for general planting.

Scleranthus biflorus — Caryophyllaceae !

INFO
Common Name: Two flowered Knawel, Canberra Grass
Perennial Herbaceous
Height: 0.2ft. Spread: 3ft.
Flowers Yellow
Native Range: Southeastern Australia, Tasmania
Description: Scleranthus biflorus is a bright green cushion-like perennial herb of attractive compact growth habit. The plant is only a few centimetres high with a spread of approximately 40 cm. Grown often as a border, ground cover or rockery plant in full sun, the fine textured, rather 'moss-like' appearance contrasts well with broad-leaved plants. The degree of compactness of individual plants is related to origin, with lowland forms exhibiting a more open habit. The petal-less flowers of S. biflorus appear during November and December in the ACT, the calyces being yellow-green in colour. Flowers are very small and in terminal pairs on a common peduncle. The peduncle elongates from 1 -4 cm and, being straw coloured, contrasts with the foliage in an unusual way. The fruit is a one-seeded hardened nutlet enclosed by the persistent calyx. The leaves of S. biflorus are rigid and crowded, 0.5-1 cm long, and occur towards the apex of the stems. The procumbent stems, being congested, give the plant a mound-like appearance.
Cultivation: When this plant is being sited in the garden, a position in full sun with adequate moisture will ensure the optimum growth conditions. Soil types do not appear to be critical. The pathogenic fungus Rhizoctonia sp.can be responsible for some dead areas appearing within a plant mound. If the mound is cleaned out and a suitable fungicide applied, new plant growth will replace that lost. Weedless garden areas are preferable for cultivation, as strong growing weeds such as sheep sorrel (Rumex acetosella) and oxalis (Oxalis corniculata) which thrive in acid soils, may grow through the plants and spoil the compact appearance.
Propagation: Growth is relatively slow; however, well established plants may be easily divided and the divisions successfully replanted. New plants may also be produced in time from seed.
Record Notes: Name checked in APNI 3/25/2004.

Taxon Family Spelling Checked

Scoliopus bigelovii Liliaceae !

INFO
Common Name: California fetid adders tongue
Perennial Geophyte
Native Range: California
Description: Stems 6–20 cm. Leaves 2–3(–4), petiolate; blade often mottled with purple, elliptic to oblong, 14–24 × 4.5–8 cm. Flowers 3–12; outer tepals mottled with green and purple, ovate-lanceolate, 12.5–19 mm; inner tepals linear-subulate, 11.5–19 × 0.5 mm; filaments 2.3–4.3 mm; anthers 2–2.8 mm; style 4.5–6 mm; stigmas strongly recurved; pedicel strongly recurved in fruit, 11–22 cm. Capsules 22–30 × 6–9 mm, including beak. 2n = 16.

image of 1969 D. Cavangnaro

Flowering late winter–early spring. Redwood and coastal coniferous forests, mossy mountain stream banks, shaded slopes; 0–500 m; Calif.

R. Y. Berg (1959) demonstrated for Scoliopus bigelovii (and his findings also apply to S. hallii) that a single flower functions as three independent pollination units, a feature usually associated with Iris (F. H. Utech 1992).

Scrophularia californica Scrophulariaceae !

INFO
Common Name: California figwort
Perennial Herbaceous
Flowers Brown-maroon with yellow-green
Native Range: California - British Columbia
Description: Perennial, minutely glandular
Stem 8–12 dm
Leaf: blade 7–19 cm, ovate to ± triangular, truncate to cordate, acute, crenate to deeply dissected; petiole 3–7 cm
Inflorescence narrow, compact to widely spreading
Flower: calyx 3–4 mm, lobes obtuse to long-tapered; corolla 8–12 mm, upper half brown-maroon, lower half paler or yellowish green, lowest lobe recurved; staminode club-shaped to obovate, brown to light maroon, longer than wide; nectary inconspicuous
Fruit 6–8 mm, conic-ovoid
Ecology: Common. Moist places, roadsides, chaparral
Elevation: < 1500 m.
Bioregional distribution: Northwestern California, s Sierra Nevada, Central Western California, South Coast, Western Transverse Ranges
Distribution outside California: to British Columbia

Scrophularia calliantha Scrophulariaceae !

INFO
Common Name: canary figwort
Perennial Shrub
Flowers orange-red flowers with a yellow center
Native Range: Canary Is
Description: Canary Figworts are evergreen perennial subshrubs with a dense basal leaf rosette and several branching stalks with numerous small wine-red flowers. The showiest member is the rarest in its' genus: Scrophularia calliantha from open spots in few remaining sites of native laurel forest on Gran Canaria. It makes tall stalks with utmost beautiful, large bi-colored orange-red flowers with a yellow center.
Cultivation: All Scrophularia species will grow well in any rich, well drained soil in a sunnny spot throughout the year. In winter keep drier at a minimum of some 10°C.
Record Notes: Name checked with The Plant List on 6/18/2013 by Mona Bourell.

Scutellaria baicalensis Lamiaceae !

INFO
Common Name: Baikal skullcap
Perennial Herbaceous
Flowers Purple-red to blue
Native Range: Temperate Asia
Synonomy: Scutellaria lanceolaria Miquel; S. macrantha Fischer.
Description: Herbs perennial. Rhizomes fleshy, to 2 cm in diam., branched. Stems ascending, (15-)30-120 cm tall, much branched, subglabrous or antrorsely to spreading puberulent. Petiole ca. 2 mm, puberulent; leaf blade lanceolate to linear-lanceolate, 1.5-4.5 × (0.3-)0.5-1.2 cm, papery, glab-rous or sparsely puberulent, abaxially densely impressed glandular, base rounded, margin entire, apex obtuse. Racemes terminal, 7-15 cm; basal bracts similar to stem leaves, upper ones ovate-lanceolate to lanceolate, 4-11 mm, subglabrous. Pedicel ca. 3 mm, puberulent. Calyx ca. 4 mm, ca. 5 mm in fruit, densely puberulent outside, margin ciliate, glabrous inside; scutellum ca. 1.5 mm, ca. 4 mm in fruit. Corolla purple-red to blue, 2.3-3 cm, densely glandular pubescent outside, pubescent on saccate part inside; tube conspicuously bent near base, throat to 6 mm wide; middle lobe of lower lip triangular-ovate, ca. 7.5 mm wide. Nutlets black-brown, ovoid, ca. 1.5 × 1 mm, tuberculate, adaxially umbonate near base. Fl. Jul-Aug, fr. Aug-Sep.
Native habitat: Sunny grassy slopes, waste and cultivated areas; 100-2000 m. Gansu, Hebei, Heilongjiang, Henan, Hubei, Jiangsu, Liaoning, Nei Mongol, Shaanxi, Shandong, Shanxi [Japan, Korea, Mongolia, Russia]

Traditionally used as a febrifuge, for relieving fever, and diminishing inflammation. This is one of the most commonly collected species in China.

Record Notes: Name checked with IPNI, Flora of China, 4/15/2010.

Scutellaria tuberosa Lamiaceae !

INFO
Common Name: common skullcap, Danny's skullcap,
Perennial Geophyte
Spread: .25ft.
Flowers Purple Spring
Native Range: USA: OR, CA, Baja Ca
Not Invasive
Description: Blue flowers 12 to 21 mm long, 5 to 21 cm tall from creeping tuberous rhizomes, blooms April-May on dry coastal slopes. The stems are often sticky and hairy, branched at the base. The hairy leaves have ovate blades 13 to 25 mm long, coarsely dentate on short petioles. Flowers are solitary in the axils and borne on pedicels 2 to 3 mm long. Seeds black and coarsely toothed (not banded like californica or bolanderi). Two sub species differ mainly in the pubescence below the inside middle corolla (subsps. similis being smooth and subsps. australis being hairy). Southern California and Baja California and northward into southern Oregon and Sierra Nevada. Habitat: Brushy edges and open woods to 2000', chaparral, throughout cismontane southern California

Sedum 'Spiral Staircase' Crassulaceae !

INFO
Common Name:
Perennial Succulent
Flowers White
Synonomy: possibly = Sedum mexicanum
Description: From the article by James E. Low:
Similar to S. mexicanum - Note: Some nurseries sell another sedum under this name, but it is unrelated: it has white flowers and is called the "Spiral Staircase" and is probably some odd hybrid, but is vigorous growing and popular in nurseries for sale under this wrong name

Quoting:
MEXICANUM [Britton, 1899] Cent. America, growing high up on volcanos, n=18, this odd species has no known relatives in the New World, but seems closest to some in eastern Asia (according to botanist Uhl). It may be in section Orientalia, though it is not found wild in the Orient, thus it presents a mystery. Its species name refers to Mexico, but even this is in total error. It was learned that it was first found by botanists growing in cultivation in Mexico City, thus the name; but it is found wild only in Central America. It is of easy culture and is grown widely in gardens in warm climates, but it survives frost and has naturalized in parts of south Europe. This is the only yellow flowering sedum with leaves in whorls of 4. This fact serves to identify it. .

=*S. mexicanum [Britton, 1899] current.
Record Notes: Name checked with The Plant List on 4/19/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Sedum dasyphyllum — Crassulaceae !

INFO
Common Name:
Perennial Succulent
Description: Classic evergreen perennial groundcover forms a low carpet of tiny round powdery blue-grey leaves, remaining evergreen in mild regions. Clusters of white star flowers appear in early summer. A perfect choice for the rock garden, between stepping stones or in the crevices of dry walls.

Cultivation: Cold hardiness zones: 5 - 9
Light needs: Full sun
Water Needs: Once established, needs only occasional watering.
Average landscape size: Moderate grower to 2 to 4 in. tall, 8 to 12 in. wide.

Sedum dendroideum — Crassulaceae !

INFO
Common Name: bush sedum
Perennial Succulent
Height: 1-3ft. Spread: 3-4ft.
Flowers Yellow Jan, Feb, Mar
Native Range: Mexico
Description: Tallest Sedum.

Sedum dendroideum (Bush Sedum) - A small shrub to 1 to 3 feet tall spreading to 3 to 4 feet wide and rooting along stems to form large mass. The 1 1/2 long green leaves of this plant are spathulate with an almost ovate leaf that is easily distinguished from the only other similar species, Sedum praealtum, by the presence of subepidermal glands along the leaf margin. The large clusters of small vivid yellow star-like flowers form above the foliage in late winter and early spring.
Record Notes: Spelling checked with Tropicos, 5/17/2011

Sedum kamtschaticum Crassulaceae !

INFO
Common Name: orange stonecrop
Perennial Succulent
Flowers Yellow
Native Range: N. China, E. Siberia, Kamchatka
Description: A clump-forming stonecrop from Siberia, Manchuria and east Asia, growing up to 9" with large toothed leaves sometimes edged with white. Large clusters of bright yellow stars in July and August. The old stems die back in the fall, but new ones appear from the center of the clump and remain green all winter. After the flowers fade on all varieties, the seed pods turn red and remain attractive.
Cultivation: Easy with good drainage. Zones 3-8.
Record Notes: Name checked with The Plant List on 5/24/2012 by Mona Bourell.

Sedum polytrichoides Crassulaceae !

INFO
Common Name:
Native Range: China, Japan, Korea
Description: Herbs perennial. Sterile shoots numerous. Stems ascending, tufted, slender, 5-10 cm, woody. Leaves alternate; leaf blade linear to linear-lanceolate, 5-11 × 1-2 mm, base spurred, apex acute. Cyme 2-4-branched, many flowered. Flowers shortly pedicellate, unequally 5-merous. Sepals lanceolate-ovate, equal, 1.5-2.5 mm, base spurless, apex acute. Petals yellow, narrowly lanceolate, 5-7 mm, apex acuminate. Stamens 10, slightly shorter than petals. Nectar scales minute, base cuneate, apex broadly rounded. Carpels ± erect. Follicles stellately divergent, ovoid-oblong, 4.5-5 mm, many seeded, base connate for ca. 1.5 mm, apical beak erect, ca. 1.5 mm. Seeds oblong, less than 1 mm. Fl. Jul-Aug, fr. Aug-Sep.

Rocky slopes; ca. 1000 m. Anhui, Heilongjiang, Henan, Jiangxi, Jilin, Liaoning, Shaanxi, Shandong, Zhejiang [Japan, Korea].

Sedum spurium 'Dragon's Blood' Crassulaceae !

INFO
Common Name:
Perennial Succulent
Flowers red, pink, or pinkish-white
Description: Form
short herbaceous semi-evergreen groundcover
maturing at about 4" tall in foliage and 6" tall when in flower, quickly spreading to form mats of dense stems and miniature foliage
procumbent mat growth habit, becoming a prostrate mat in Winter
slow to medium growth rate (in clump diameter)

Foliage
semi-evergreen succulent leaves are green, bronzed, red, crimson, or variegated (depending upon cultivar), usually absciscing all but the most terminal leaves by late Winter, with the remaining leaves staying bronzed into the following Spring
opposite (or clustered at the stem apices), obovate (fan-shaped), crenate, and sessile to short-petioled

Flowers
red, pink, or pinkish-white, flowering profusely for two to four weeks in June and July, especially on mature plants that are under a moderate amount of stress (or put another way, those that have it "good" in terms of soil, moisture, and nutrition tend to have predominantly lush vegetative growth rather than reproductive growth)
erect inflorescences occur above the foliage, with the vertical peduncles radiating flat-topped pedicels at the apex, bejeweled with many five-petaled, star-like flowers

Fruits
wirey pedicels are the predominate feature on the fruiting heads, and will persist into the following season if unsheared and will detract somewhat from the superior foliage effect
best to dead-head after flowering, to promote vegetative growth
Cultivation: Culture
full sun to partial shade
performs best in full sun in moist, well-drained soils, but it is extremely urban tolerant, and is usually reserved for highly stressful sites around rockery that exposes it to thin soils, poor soils, very dry soils, soils of various pH

Sedum telephium 'Autumn Joy' Crassulaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers Pink Sept
Synonomy: Hylotelephium telephium (L.) H. Ohba, Sedum 'Herbstfreude'
Description: ts large rosy-coral flower heads stand about 15" -18" high on a plant about 2' wide at maturity.
Cultivation: It is drought-tolerant, not fussy about soil as long as it is well-drained, and puts on a show at the time of the year when our gardens can use a burst of color.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with Tropicos on 11/28/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Sedum telephium 'Munstead Dark Red' Crassulaceae !

INFO
Common Name:
Perennial Succulent
Flowers Crimson rose
Description: An older but reliable selection of upright Stonecrop, excellent for late summer and fall interest. This British selection produces branching heads of crimson-rose flowers, over a mound of succulent green leaves that are tinged red during summer. Dried seedheads have good winter interest. Sometimes floppy in moist and rich sites; pinch growth back by half in June to reduce the height if desired. Outstanding cut flower, and also attracts butterflies. Easily divided in spring.

Taxon Family Spelling Checked

Selaginella kraussiana Selaginellaceae !

INFO
Common Name: Krauss' spikemoss, trailing spikemoss
Perennial Herbaceous
Spread: 1ft.
Native Range: South Africa
Description: Plants terrestrial, forming diffuse mats. Stems long-creeping, branched, branches 3-forked, flat, articulate, glabrous. Rhizophores borne on upperside of stems throughout stem length, 1–3 mm diam. Leaves delicate, papery. Lateral leaves nearly perpendicular to stem, well spaced, green, lanceolate, 2.5–3.6 X 0.8–1.2 mm; base rounded; margins slightly transparent to green, dentate; apex acute. Median leaves lanceolate to linear-lanceolate, 2–2.7 X 0.6–0.8 mm; base with small outer auricle; margins slightly transparent to green, dentate; apex acuminate. Strobili solitary, 0.2--2.5 cm, with only 1 megasporangium, megasporangium basal; sporophylls keeled, dentate, strongly tapering toward apex, base glabrous, margins denticulate, apex acuminate; megasporophylls larger than microsporophylls, in groups of 4, 2 like vegetative leaves, 2 like sporophylls, of the latter 1 large, lanceolate-elliptic, 1 smaller, falcate-lanceolate; microsporophylls lanceolate to narrowly ovate-lanceolate. 2 n = 20.
Cultivation: Selaginella kraussiana is one of the easiest of plants to grow. They require a well-drained, organically rich soil and shaded conditions. We use a soil mix consisting of 2 parts peat moss to 1 part loam to 1 part small pine bark. They like plenty of water and humidity, which makes them good terrarium subjects. They are also effective as groundcovers under greenhouse benches or for hanging baskets. They respond well to light fertilizer applications on a weekly basis during the growing season. Water should be restricted in the fall and winter, but the soil should never be allowed to dry.
Propagation: Selaginella kraussiana are propagated by stem cuttings and by division.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=17082 useage as 'accepted'. 2004-07-19.

Taxon Family Spelling Checked

Selago flanaganii Scrophulariaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft.
Flowers Pale blue.
Native Range: South Africa
Synonomy: Selago lithospermoides
Description: perennial-Dwarf shrub- Ht 1 - 1.5 m. Alt 2200 - 3300 m. Distribution: LES, EC, KN

Large pointed inflorescences that head out from an angular but very attractive branching habit. Small leaves with small bluish-white flowers. Native to scrub and grasslands. Like Selago serrata, it blooms in summer.
Cultivation: Well-drained soil is important to their survival, and they don't like freezing weather, but as this one comes from a higher altitude, it may be a hardier plant.

Record Notes: Name checked with TROPICOS, and African Fowering Plants Database, 7/13/2010.

Taxon | Family Spelling Checked

Selago serrata — Scrophulariaceae !

INFO
Common Name:
Perennial Shrub, herbaceous
Height: 1.5-2ft.
Flowers Blue-Purple Sept. , April through July.
Native Range: South Africa
Synonomy: Pseudoselago serrata? ; Selago fasciculata L.; Selago lanceolata Choisy

Not Invasive
Description: Flowers are large, flat-topped clusters and are a wonderful blue with a touch of lilac. It blooms for several months in late summer into fall. The flowers have a mild fragrance and the foliage is a nice glossy green. The leaves are stift and toothed. The branches are slender and the plant gets to be about 1-1/2 to 2' tall. http://www.anniesannuals.com/signs/s/selago_serrata.htm
Native to the fynbos habitat of South Africa.
In the Scrophulariaceae family (Mabberley 2002), although some authors place it in Globulariaceae or Plantaginaceae.
Cultivation: Sun
Low-Average water
Perennial
USDA Zones 7-10

Semele androgyna — Liliaceae !

INFO
Common Name: climbing butcher's broom
Perennial Vine/Liana
Height: 30ft.
Flowers Yellow
Native Range: Canary & Madeira Islands
Synonomy: Ruscus androgynus L.; Danae androgyna Webb & Berth.
Description: Evergreen climber shrub. Cladode glabrous, dark green, ovate-lanceolate, 5-10 cm long, acuminate, leathery, at the axils of the leaves which are reduced to unconspicuous scales. Yellowish small flowers in fascicule on the surface or on the margin of the cladode. Fruit globose about 1 cm across. Tender only for the mildest areas.
Given this name by Carl Sigismund Knuth in 1850. It is found on the Canary and Madeira Islands, growing in a rich peat with lots of water and some sun. The rhizomes grow up to four centimetres in diameter, the climbing vines can reach ten meters in length. The flowers are crème coloured or pale yellow, the fruits are red, one centimetre in diameter.
The bizarre leaves with the flowers at the edges are actually not leaves at all, but flattened branches known as phylloclades or cladodes.
Cultivation: From Univ. of Conneticut:
Culture: Online information indicates this species grows native in wet, peaty soils in semi-shade. Our tests show best growth in well-drained cactus mix, allowing to dry between watering with regular fertility.
Soil tests (Aug '05 - March '07):
Cactus Mix - best - good vegetative growth, good root system
Peat-Lite - marginal - roots healthy, but not as well developed, limited top growth
Rich Sandy Loam - good root growth, intermediate top growth
Regular Soil - moderate root system, but not as healthy as CM/RSL - intermediate top growth.

Taxon Family Spelling Checked

Senecio glastifolius Asteraceae !

INFO
Common Name: Large Senecio, Waterdissel, Holly leaved senecio
Perennial Herbaceous
Height: 3-6ft. Spread: 2-3ft.
Flowers Purple Mar, Apr, May
Native Range: South Africa
Potentially Invasive
Description: Upright perennial, growing about 3 (to 5 at SFBG) feet tall with a woody base and glossy green foliage along the branched stems. The cheerful flowers are large daisies, a single row of mauve petals around a yellow centre, formed at the tips of the stems.

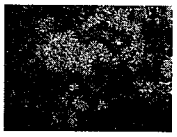

image of © 2005 Joseph Favetti, SFBG

Senecio glastifolius occurs naturally on the south coast of South Africa from George to Humansdorp in Eastern Cape. It grows in the fynbos, with restios and proteas where it usually prefers the wetter areas. This water loving habit has given it the common name waterdissel, which translates to water thistle. Senecio glastifolius is often seen after fires and in disturbed areas where it is one of the first pioneers to germinate. The edges of the lanceolate (lance-shaped) leaves are coarsely toothed and can be quite prickly. These leaves are so distinct that even the young seedlings are easy to recognize in the veld.

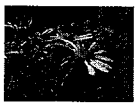

image of © 2005 Tony Morosco SFBG1992-0813

From a distance, Senecio glastifolius can be confused with Senecio elegans. Senecio elegans, the veld cineraria, is an annual. Close up the two are very different, Senecio elegans is a much softer plant with more succulent and hairy leaves and stems than Senecio glastifolius.

image of © 2005 Tony Morosco SFBG1992-0813

Cultivation: Not a very long-lived perennial, but is well worth growing for spring colour. Its height makes it perfect to use at the back and in the middle of beds, combined with smaller Namaqualand daisies in the front. Senecio glastifolius also makes a lovely combination with perennials that flower at the same time, such as Scabiosa africana, Anchusa capensis, Osteospermum ecklonii, Geranium incanum and Pelargonium betulinum. It is superb mixed with the white flowers of Watsonia borbonica ssp. ardernei.

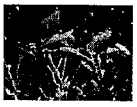

image of © 2005 Tony Morosco SFBG1992-0813

Invasive in Australia & New Zealand. SFBG Gardener reports that it self-sows freely at SFBG 4/6/2005.

Senecio mandraliscae Asteraceae !

INFO
Common Name: Blue Chalk Sticks
Perennial Herbaceous
Height: 1.5ft. Spread: 2ft.
Flowers White Summer
Native Range: South Africa
Synonomy: Senecio talinoides var. mandraliscae (Tenio) G.D. Rowle, Kleinia mandraliscae
Potentially Invasive
Description: Spreading succulent from South Africa that grows to 12 to 18 inches tall with 3 to 4 inch long blue gray pencil-like fleshy leaves and small rayless dull white flowers in mid-summer. Forms a dense mat with leaves angled upward from the ground. A great groundcover. . In the most current reference we have available, the Illustrated Handbook of Succulent Plants: Dicotyledons edited by Urs Eggli (2002), the contributor for this section, Gordon Rowley, lists Senecio talinoides var. mandraliscae (Tenio) G.D. Rowley as the correct name and notes that this is a "mysterious taxon, probably a hybrid". We also have a hybrid of this plant created by John Bleck that we call 'Jolly Gray'. It was the result of a cross between it and Senecio talinoides var. aizoides.
Cultivation: Drought tolerant but tolerates regular irrigation. Plant in full sun to light shade. Hardy to 10 -15° F.
Record Notes: Name found on IPNI, but not with GRIN, TROPICOS, nor African Flowering Plants Database... 3/24/2010.

Senecio serpens — Asteraceae !

INFO
Common Name: Blue-chalksticks, Dead Man's Fingers
Perennial Herbaceous
Native Range: S. Africa
Description: A very distinctive succulent with spiky bluish-grey foliage. Ideal as a ground cover or as a trailing plant in hot dry locations. Evergreen. Senecio serpens is similar to the Senecio mandraliscae with smaller leaves: 1.5 inches long versus 3 inches (4 cm vs. 8 cm). It is also less heat resistant and is almost impossible to keep alive when the temperature exceed 100 °F (38 °C) for too long.
Cultivation: Semi-hardy. Full sun

Senna candolleana — Fabaceae !

INFO
Common Name: Quebracho
Perennial Shrub
Height: 6-10ft.
Native Range: Chile
Synonomy: Senna closiana, Cassia closiana
Description: Information coming from Jason Dewees

image of © 2009 Mona Bourell, SFBG1992-0675

An evergreen shrub best-known for its amazing golden yellow blooms which brighten the bush in huge numbers for much of the Spring and Summer.
Description
Bushy tree to 6-10ft. Leaves contain many small leaflets common amongst legumes. The golden yellow flowers are born in large clusters and remain on the bush for several weeks. A slender, woody fruit that can grow to 3 -4" follows, containing several hard seeds.
Hardiness
Probably hardy to 20-22F.
Growing Environment
Grow in full sun. Fairly drought hardy once established. Provide supplemental water when young.
Propagation
By seeds. They can be soaked for 24-48hrs prior to planting. Plant in well-drained soil, keep at 75-85F. Seeds generally take several weeks to germinate.
Uses
Planted as an ornamental. Makes a nice shrub for hot and dry regions.

image of © 2007 Mona, SFBG1992-0675

Cultivation: This species has the following hardiness:
USDA Hardiness Zone 9. The plant does not tolerate snow, but can tolerate occasional freezing spells of about - 5° C (the typical morning frost of central Chile).
Relatively easy to cultivate

Hardiness
Probably hardy to 20-22F.
Growing Environment
Grow in full sun. Fairly drought hardy once established. Provide supplemental water when young.
Propagation:
Propagation
By seeds. They can be soaked for 24-48hrs prior to planting. Plant in well-drained soil, keep at 75-85F. Seeds generally take several weeks to germinate.

Sequoia sempervirens Cupressaceae !

INFO

Common Name: Coast Redwood, redwood, California redwood
Perennial Tree
Height: 180-300'ft.
Native Range: California
Description: Tree to 60-100(110) m tall and 300-460(900) cm dbh. Trunk much enlarged and buttressed at the base and often with rounded swellings or burls, slightly tapering. Crown crown conic and monopodial when young, narrowed conic in age, irregular and open. Bark red-brown, to ca. 35 cm thick, tough and fibrous, deeply furrowed into broad, scaly ridges; inner bark cinnamon-brown. Branches downward sweeping to slightly ascending. Twigs slender, dark green, forking in a plane, ending in a scaly bud. Leaves 1-30 mm, generally with stomates on both surfaces, the free portion to 30 mm, those on leaders, ascending branchlets, and fertile shoots divergent to strongly appressed, short-lanceolate to deltate, those on horizontally spreading to drooping branchlets mostly linear to linear-lanceolate, divergent and in 2 ranks, with 2 prominent, white abaxial stomatal bands. Pollen cones nearly globose to ovoid, 2-5 mm, borne singly on short terminal or axillary stalks. Female cones 12-35 mm long, elliptical, reddish-brown, with many flat, short-pointed scales; pendant at end of leafy twig; maturing in one season; with 2-5 seeds per scale, light brown, 2-winged. Seeds flattened, 3-6 mm, leathery. 2n= 66 (Little 1980, Watson 1993).

Sequoia sempervirens 'Adpressa' Cupressaceae !

INFO

Common Name:
Perennial Tree
Height: 50 - 75ft.
Description: Slow growing evergreen tree, broadly conical to 50-75 ft. Leaves 0.2-0.3 inch long, dense. Young shoots are tipped with creamy white; more cold hardy than species.

Often listed as a dwarf conifer but will produce vertical shoots and unless removed will become tree-like,

Cultivation: Sun; moist well drained soil
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 4/16/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Sequoia sempervirens 'Nana Pendula' Taxodiaceae !

INFO
Common Name: dwarf weeping redwood
Perennial Tree, dwarf
Height: 1ft. Spread: 6-12ft.
Description: An intriguing prostrate form of the coast redwood. Bluish-green leaves on pendulous branches spread out in a circular form under 1 ft. tall. And interesting specimen or container subject for lightly shaded areas with regular water. Grows much slower than the upright tree form of coast redwood, with the branches achieving a spread of around 6 to 12 ft. in ten years.
Record Notes: Name checked with The Plant List on 1/11/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Notes
7/31/2013 Mona Bourell — Location 47 removed from database by Mona Bourell on 7/31/2013 Reason: Owen reports that disease was first spotted in this tree in 1998. Beetle infestation caused rapid decline and tree is now dead.. Location Details at time of removal: Bed: 47 (Western Australia) # Plants: 1 Planting Date: Last Checked: 2/26/2009 Mona Bourell Location Notes: north end of bed Location

11/2/2009 Olivier Thériault — 2 plants found in 0D2 during nursery inventory, 11/2/2009. Location added.

5/21/2007 David Kruse-Pickler — Noted by Susan Nervo that this tree most likely had Sphaeropsis about 10 -15 years ago at the very top. One foot of the leader was cut and there has been no sign of Sphaeropsis ever since. The unique shape to the top of this tree is a result of this removal.

Taxon Family Spelling Checked

Seriphium plumosum — Asteraceae !

INFO
Common Name:
Perennial Shrub
Native Range: South Africa
Synonomy: Stoebe cinerea var. plumosa (Less.) Harv., Stoebe plumosa (L.) Thunb., Elytropappus ruschianus Dinter (1932) , Artemisia ambigua Thunb., Artemisia vermiculata L. , Stoebe burchellii Levyns (1937), Stoebe vulgaris Levyns (1937), Stoebe fasciculata Cass. (1827), Stoebe virgata Thunb., Seriphium plumosum var. glabriusculum DC, Seriphium plumosum var. canescens DC.

Description: perennial- Shrub- Ht 0.6 - 1.5 m. Alt 0 - 2200 m. Distribution: LES, NAM, EC, FS, GA, KN, LP, MP, NC, NW, WC, SWZ
At first glance, Seriphium plumosum appears to be a sprawling, much-branched, grey shrub. Looking closer, one notices that the slender, wiry branches are softly woody and at right angles to the stem. The short shoots are covered with whitish, woolly, clustered leaves, which are minute, tufted and pressed to the stem, giving the plant a granular appearance.

In the wild there are different forms, varying in colour. The silver-grey form that is grown at Kirstenbosch is usually found at higher altitudes and has slightly thicker stems.

The flowerheads are grouped in small clusters towards the ends of the main shoots, forming a spike-like inflorescence. Pale brown bracts surround the purple disc florets and give the spikes a golden appearance. Flowering is mainly in autumn/winter, from April to June, but also in spring.

Distribution
The genus Stoebe consisted of 34 species occurring mainly in the Western Cape (25 species) but also in southern tropical Africa, Madagascar and Reunion. It was recently revised by Koekemoer (2002) and Stoebe plumosa was combined with some other stoebes as Seriphium plumosum. S. plumosum is quite common and has a widespread distribution throughout South Africa.

Sesleria caerulea Poaceae !

INFO
Common Name: Blue Moor Grass
Perennial Graminoid
Height: 0.5 - 1ft. Spread: 0.5 - 1ft.
Flowers Purple, Black Mar - June
Native Range: Europe
Synonomy: Cynosurus caeruleus L. Sp. Pl. 1: 72. 1753
Description: Named to honor Leonardo Sesler, an 18th-century physician and botanist, this European native's sturdy tuffet fashions a long-lived and versatile, noninvasive ground cover. Easily cultivated, low growing Blue Moor Grass puts forth a dense evergreen mound of soft, two-toned leaves, which are glaucous blue on top and dark green beneath. Twisted and curvy, the leaves present a cooling blue-green base for the small spiky panicles of purplish black flowers that mature to a silvered green.

With enough fortitude to handle cold weather and alkaline soils, Sesleria caerulea is paramount as a filler between larger grasses or for edging a pathway, and equally impressive when massed.
Record Notes: Name checked with The Plant List on 4/11/2012 by Mona Bourell.

Taxon Family Spelling Checked

Sesleria heufleriana Poaceae !

INFO
Common Name: blue-green moor grass
Perennial Graminoid
Height: 16-20 inchesft.
Native Range: Southeastern Europe
Description: Sesleria heufleriana (Blue-green Moor Grass) - This native to southeastern Europe is very similar to Blue Moor grass (S. caerulea) but larger, taller, and a little less blue. The foliage forms neat tufted mounds to 15 inches with the upper surfaces of the leaves emerging as mostly green in spring, becoming glaucous-blue by early summer through autumn and winter. The early spring flowers are black with cream-yellow pollen sacs, held above the foliage on slender stalks. It is semi-evergreen even in colder climates. Hardy to Zone 4.
Cultivation: Conditions: full sun to part shade; well drained soil; tolerant of heat and drought
Coldest zone: 4
Ideal conditions: well drained soil. Full sun to part shade. Tolerant of heat and drought. Looks its best in some shade and with some additional watering in dry climates.

Record Notes: Name checked with The Plant List on 4/11/2012 by Mona Bourell.

Shibataea kumasaca — Poaceae !

INFO
Common Name: Ruscus leaf Bamboo, Okame Zasa, Bungo Z.
Perennial Graminoid
Native Range: Japan, China
Description: Culms ca. 1 m, 3–4 mm in diam.; internodes glossy, glabrous; wall thick with small lumen; nodes with ridge strongly raised; intranode to 3–5 mm. Culm sheaths papery, appressed pubescent, outer margin ciliate; auricles absent; oral setae few or absent; ligule truncate or arcuate, to 3–4 mm, pubescent, apex ciliolate; blade lanceolate, small. Branches 3–5(or 6) per node, 0.5–1.5 cm, equal in diam., 2–4(–6)-noded, axillary prophyll usually persistent; branch sheaths gradually deciduous or persistent and disintegrating in situ, membranous. Leaves 1(or 2) per ultimate branch; blade adaxially deep green, ovate or narrowly ovate, 2.5–18 × 0.6–3.5 cm, abaxially glaucous and pubescent, adaxially glabrous, secondary veins 6–9-paired, tessellations rectangular, base broadly cuneate to rounded, apex acuminate. Flowering branches at lower nodes of leafy branches or rarely at nodes of culms, usually rebranched, secondary branches comprising a prophyll, few bracts, and (1 or)2–5 pseudospikelets; pseudospikelets consisting of a prophyll, 0 or 1 empty bract, 2 or 3 gemmiferous bracts, and a terminal spikelet. Spikelets with 3–7 florets, lower 1–3 bisexual, others male or sterile. Lemma thin; palea membranous; lodicules thinly membranous, ovate. Anthers yellow. Ovary narrowly ovoid; style 1; stigmas 2 or 3. Caryopsis narrowly ovoid. New shoots May–Jun. 2n = 48*.

* Mountain slopes. Fujian, Zhejiang; cultivated in Anhui, Guangdong, Jiangsu, and Taiwan [widely cultivated in Japan].

The specific epithet has been erroneously spelled "kumasa" by some authors.

A cultivar with yellow-striped leaves, Shibat'a kumasaca 'Aureostriata', is grown. The species is introduced in many countries as an ornamental

Taxon Family Spelling Checked

Shortia soldanelloides — Diapensiaceae !

INFO
Common Name:
Perennial
Native Range: Japan
Description: Evergreen tufted herbaceous suffrutices; rhizome prostrate, woody, loosely branched, upper part ascending. Leaves all radical, crowded; petiole 2–7 cm long, glabrous; blade thinly coriaceous, glabrous, orbiculate or orbiculate-ovate, 2–6 cm long, 1.5–5 cm wide, apex rounded and slightly retuse, base rounded-truncate or slightly cordate, with 5–14 paired obtuse apiculate shallow teeth, upper surface lustrous, light green, with slightly depressed midrib and lateral nerves, lower surface pale green, with slightly raised midrib and lateral nerves, lateral veins 3–5, more or less joined near base and somewhat arched-ascending. Flowers July to August. Inflorescences terminal, covered by persistent ovate bud-scales at base, erect, 9–15 cm long at flowering, 15–30 cm long at fruiting, glabrous, with 3–20 flowers. Pedicel 2–3 mm long at flowering, to 10 mm long at fruiting. Bracts 3, scattered on pedicel, the uppermost one approximate to calyx, membranaceous, linear to filiform, 3–8 mm long, acute, glabrous. Sepals 5, free, persistent, oblong or oblong-ovate, apex obtuse or rounded sometimes shallowly emarginate, minutely pilose on upper margin. Corolla purple, tubular-campanulate, 10–15 mm long, 8–13 mm across, 5-cleft; lobes obovate, 5–7 mm long, deeply and finely lacerate. Stamens 5, adnate to corolla tube, free part ca. 1.5 mm long. Staminodes 5, adnate to base of corolla tube, filiform, apex acute, lanate. Ovary globose, glabrous; style filiform 7–8 mm long, apex truncate. Capsule ripening August to September, globose, with 3 longitudinal grooves, ca. 3 mm long, 3.5 mm wide, with numerous seeds, dehiscing by 3 valves leaving a thick placenta. Seeds fusiform, ca. 1 mm long, 0.4 mm across, with thin testa containing an ellipsoidal body ca. 0.7 mm long; testa hyaline, reticulate, forming a short projection at one end.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Sidalcea malviflora Malvaceae !

INFO
Common Name: Checker Mallow
Perennial Herbaceous
Flowers Pink with white veins
Native Range: Oregon to Baja California
Description: Perennial from generally well developed rhizomes and woody caudex
Stem 1.5–6 dm, generally hairy; hairs variable
Leaves variable, generally toothed or lobed; upper leaves generally much reduced
Inflorescence dense to open; lowest bracts often leaf-like, divided to base
Flower: calyx 5–12 mm in flower, generally slightly enlarged in fruit, generally densely stellate and bristly, bristles often on a swollen pad; petals 10–20(35) mm, bright to deep pink, generally white-veined
Fruit: segment 2.5–4 mm, generally coarsely pitted and net-veined (generally more so on sides than back)
Ecology: Common. Generally open, ± dry places in forest or scrub
Elevation: < 2300 m.
Bioregional distribution: California Floristic Province (except s High Sierra Nevada, Tehachapi Mountain Area, Sacramento Valley)
Distribution outside California: Oregon, Baja California
Highly variable intergrading complex with many local variants

Notes

Sideritis oroteneriffae Lamiaceae !

INFO
Common Name: Canary Is white sage, ironwort
Perennial Herbaceous
Description: 50 (100)cm, densely pubescent, white to grayish white, more or less egg shaped leaves and a lax inflorescence. From the upper pine forest zone in central Tenerife. VI-VIII.

(Canary Island White Sage) Thick, almost succulent leaves are so furry and white that everyone that sees this Canary Island native reaches out to stroke it. A true standout in a hot dry garden, this tough plant is the perfect background to show off the brightly colored flowers of many Salvias.

Tiny yellow flowers in whorls are not showy, but clearly identify this plant as a close relative to Salvias. Rare in cultivation, this is a fine garden plant for harsh conditions - and even grows well for us on the Northern California Coast.

Cultivation: Grow in dryish, well drained soil in full sun
Record Notes: Name checked with The Plant List on 4/16/2012 by Mona Bourell.

Orig. Qty: 3
Material: 7 gallon
Farm Life seal #733589. Unknown location of seal #733208. Although not sweet itself this miraculous fruit, consumed fresh and allowed to coat the mouth alters your tastebuds so that everything you eat for around 30 minutes afterwards tastes sweet. The beauty of it is that it only removes the sourness 'acidity' from what you are eating, the natural aroma and taste remains. For success the plant prefers a pH as low as 4.5. A great companion for your blueberries.

Notes

1/30/2007 Tony Morosco — Location record for Conservatory of Flowers Bed Number 102A removed, since it is no longer jointly managed with SFBG. This was only location noted, so deaccessioned record.

Silene atropurpurea — Caryophyllaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers Magenta, deep reddish-mauve
Native Range: Greece
Synonymy: Lychnis atropurpurea (Griseb.) Nyman

Description: Rarely-seen, showy, hardy perennial opens bright heads of deep reddish-mauve flowers in loose sprays during summer, above the evergreen rosette of basal foliage. If grown in a very well-drained spot, this plant will slowly evolve into a tight rounded shrub, and considering its origin, it is very well adapted to a dry situation.

Silene coronaria Caryophyllaceae !

INFO
Common Name: rose campion
Perennial Herbaceous
Height: 2.5-3ft.
Flowers Magenta
Native Range: Europe - Asia
Synonomy: Lychnis coronaria Desr.
Description: It is a perennial growing to 80 cm (31 in) tall by 45 cm (18 in) wide, with grey felted leaves and single, bright magenta flowers produced in succession in late summer. Though short-lived, the plant readily self-seeds in favourable locations. It is sometimes grown as a biennial.[1] It has gained the Royal Horticultural Society's Award of Garden Merit.

Silene perlmanii — Caryophyllaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers White
Native Range: USA: Hawaii
Description: Silene perlmanii, was historically found in two populations on the island of O'ahu, but has not been seen in the wild since 1997, and today exists only in cultivation at the National Tropical Botanical Garden.

S. perlmanii, a member of the pink family (Caryophllaceae) is a clump forming sub shrub that forms its clumps with erect to ascending stems. The leaves of S. perlmanii are elliptic in shape (50 to 105 mm long, 7 to 16 mm wide) and glabrous in texture except for the upper surface of the leaf that is strigose (straight, stiff, sharp hairs) towards the base. The flowers of S. perlmanii have stamens that are extended beyond the calyx with white petals (8 to 10 mm long). This species is the only member of its genus found on the island of O'ahu, and can be distinguished from other Silene species by its white petals and long calyx that is covered with short hairs. (Wagner et al. 1999)

Silene viscaria 'Splendens' Caryophyllaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 1-1.5ft.
Flowers Magenta
Native Range: Europe - W Asia
Synonymy: Lychnis viscaria 'Splendens'
Description: Lychnis(Silene) viscaria is a reddish-purple flowered catchfly that is native to sandy meadows, dry hillside ridges, lowlands, clearings and roadsides from Europe to western Asia. From tufts of grass-like foliage (to 5" tall) rise flowering stalks (to 12-18" tall) bearing star-shaped magenta flowers (calyx to 1/2" long) in 3-6 flowered panicles which bloom from late spring to early summer. Each flower stalk is sticky (viscous) just below the flower panicle and along the internodes, thus accounting for the specific epithet and common name. Sticky stems trap insects attempting to reach the flowers.

Lychnis comes from the Greek word for lamp in reference to the bright intensity of many of the flowers in the genus.

A number of authorities (e.g., Flora of North America) now include this plant in the genus Silene as Silene viscaria.

This cultivar is also sometimes sold as 'Splendens Flore Pleno' or 'Flore Pleno'.
Record Notes: Name checked with The Plant List on 2/5/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search. Plant received as Lychnis viscaria 'Splendens' which is a synonym.

Sinobambusa tootsik Poaceae !

INFO
Common Name: To Chiku, bamboo
Perennial Graminoid
Native Range: China
Description: Culms 5–12 m, 2–6 cm in diam.; internodes initially deep green, flattened above branches, 30–40(–80) cm, glaucous, glabrous, apically minutely papillate. Culm sheaths initially red-brown, basally suboblong, leathery, slightly glaucous, setose, densely so at base, margins ciliate, apex broadly rounded; auricles very variable, scabrid, tomentose; oral setae curved, ca. 2 cm; ligule arcuate, ca. 4 mm, uniform; blade reflexed, green, lanceolate. Leaves 3–6(–9) per ultimate branch; sheath glabrous; auricles obscure; oral setae deciduous, radiate, ca. 1.5 cm, undulate; ligule truncate or subrounded; blade 6–22 × 1–3.5 cm, secondary veins 4–8-paired, margins serrulate. Spikelets 1–3(–5), lateral spikelets sessile, terminal spikelet on 2–11 mm pedicel, linear, 8–20 × 0.2–0.3 cm; florets 7–12 mm, glabrous. Lemma ovate, ca. 7 mm wide, margins ciliate, apex acute; palea elliptic; lodicules nearly rhombic, elliptic or ovate, ca. 2.5 mm, ciliolate. Anthers light yellow. Ovary glabrous; style 1, extremely short; stigmas 3, 3–4 mm. New shoots Apr–May.

Culm sheath ligule arcuate, 3–4 mm; blade green; lodicule 7–9-veined. POACEAE Tribe

Fujian, Guangdong, Guangxi [N Vietnam; introduced in Japan].

Sinojackia cf. xylocarpa Styracaceae !

INFO
Common Name: Jacktree
Perennial Shrub
Height: 6-18ft.
Flowers White May?
Native Range: China, Yunnan
Description: Deciduous oval shaped shrub to small tree in the wild. Leaves alternate, glabrous when mature, elliptic to elliptic obovate, 3-16 cm long, 2-7 cm wide, light green, serrulate. Apex acuminate, base cuneate to rounded. 3 to 5 flowers in axillary leafy racemes. White flowers about 2-2.5 cm across, with 6-7 petals, connate at base. Flowering in May. Fruit ovoid, yellow-brown, 2 cm long, with a conical to subglobose apical beak. Slender pedicel 1-2.5 (3) cm long. Seems to be hardy.
Best as single specimen or patio tree, especially effective where one can look up into the flowers.
Cultivation: Moist, well drained soil, high in organic material. Full sun, but may require part shade in warmer zones.
Record Notes: Spelling checked in IPNI 7/27/2006.

Sisyrinchium bellum — Iridaceae !

INFO
Common Name: western blue-eyed grass
Perennial Geophyte
Native Range: Ore-CA-Baja Calif
Synonomy: Sisyrinchium hesperium, Sisyrinchium eastwoodiae, Sisyrinchium greenei
Description: Herbs, perennial, cespitose, green to ashy olive when dry, to 3.8 dm, not glaucous. Stems branched, with 1–2 nodes, 1.5–5.3 mm wide, glabrous, margins entire to denticulate apically, similar in color and texture to stem body; first internode 11–33 cm, usually equaling or longer than leaves; distalmost node with 2–3 branches. Leaf blades glabrous, bases not persistent in fibrous tufts. Inflorescences borne singly; spathes green, obviously wider than supporting branch, glabrous, keels entire to denticulate; outer 14–30 mm, usually 2–7 mm longer than inner, tapering evenly towards apex, margins basally connate 4–7.6 mm; inner with keel evenly curved to straight, hyaline margins 0.1–0.7 mm wide, apex abruptly widening, ending 0.2–1.3 mm proximal to green apex. Flowers: tepals light blue to dark bluish violet or rarely purplish or white, bases yellow; outer tepals often broadly cuneate, 10–17 mm, apex rounded, truncate, or occasionally emarginate, aristate; filaments connate ± entirely, usually glabrous; ovary similar in color to foliage. Capsules tan to dark brown, globose to obovoid, 3–5 mm; pedicel erect to ascending. Seeds globose to obconic, lacking obvious depression, 1.5–2.2 mm, rugulose. 2n = 32.

image of 1973 John Kipping

Flowering early spring–late summer. Open, mostly moist, grassy areas and woods; 0–2400 m; Calif., Oreg.; Mexico (Baja California).

Sisyrinchium bellum is the most common species of Sisyrinchium in California; it is highly variable in habit, flower color, and size. Plants of serpentine areas are intermediate with S. idahoense var. idahoense; plants of the Transverse Ranges are intermediate with S. demissum.

Skimmia japonica — Rutaceae !

INFO
Common Name: Ernest Wertheim
Perennial Shrub
Native Range: Japan
Synonomy: Skimmia japonica Lindl.
Description: Dioecious shrubs, 60–200 cm tall, glabrous except for puberulous inflorescences. Branches ascending, grayish, with glandular tubercles. Leaves alternate, often falsely verticillate, petiolate; petiole 0.5--1 cm long; blade oblong-oblanceolate to narrowly obovate, 6–12 cm long, 2.5–3.5 cm wide, apex abruptly acute with obtuse tip, base cuneate, margins entire, lustrous on upper surface, yellowish and oil-dotted on lower surface. Inflorescence terminal on branches, cymose, 2–5 cm long, 4–8 cm across; peduncle puberulous. Flowers April to May, usually 4-merous, small, 5–6 mm across. Sepals and bracts minute, widely triangular, minutely ciliate. Petals narrowly oblong, 4–5 mm long, with sparse pellucid glands. Stamens as long as petals. Style deciduous, 0.8 mm long, with a somewhat capitate 4-fid stigma. Fruits drupes; globose, 6–9 mm across, red; stones 2–5, 1 seeded. Seeds with endosperm.
Record Notes: Name checked with The Plant List on 11/29/2012 by Olivier Thériault.

Sloanea sinensis Elaeocarpaceae !

INFO Common Name:
Perennial Tree
Native Range: China
Description: Trees to 20 m tall. Branchlets glabrous. Petiole 1-4 cm, glabrous; leaf blade variable, usually oblong or narrowly obovate, rarely orbicular or lanceolate, 6-9(-12) × 3-5 cm, thinly leathery, glabrous, lateral veins 5-7 per side, base cuneate, or narrowed and obtuse-rounded, margin usually entire, rarely sparsely dentate along upper margin, apex acute. Flowers fascicled. Pedicel 3-6 cm, gray pubescent. Sepals 4, broadly ovate, 6-8 × 5-6 mm, both surfaces puberulent. Petals 4, white, 7-9 mm, both surfaces puberulent, 6- or 7-incised at apices. Stamens ca. 82, ca. as long as petals; anthers ca. 3 × as long as filaments, awned at apices. Ovary ovoid, 6-loculed, 4-5 mm, pubescent; style simple, 4-6 mm, puberulent in lower 1/2. Capsule variable in size, 2-5 cm in diam., 3 -7-valved; valves variable in size, 2-3.5 cm, 3-5 mm thick; prickles 1-1.5 cm; endocarp purple-red. Seeds black, shiny, 1-1.3 cm; aril yellow, ca. 5 mm. Fl. Jun-Oct, fr. May-Nov, most frequently in Aug-Oct.

Evergreen forests, often in valleys or near streams; 700 -1000 m. Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangxi, Zhejiang [Cambodia, Laos, Myanmar, Thailand, Vietnam].

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Taxon Family Spelling Checked

Smallanthus sonchifolius Asteraceae !

INFO
Common Name: Yacón
Perennial Herbaceous
Flowers Yellow
Native Range: South America (Bolivia, Colombia, Ecuador, Peru]

Synonomy: Polymnia sonchifolius; Polymnia edulis
Description: Herbs, perennial, 1-3 m tall. Stems cylindric and hollow; underground part irregularly branched, often producing spindle-shaped tubers 100-200 mm and 30-80 mm in diam. Lower leaves broadly ovate and hastate or subhastate, connate and auriculate at base; upper leaves ovate-lanceolate, without lobes and hastate base; upper and lower surfaces densely pubescent. Synflorescence terminal, composed of 1-5 branches, each one with 3 capitula; peduncles densely pilose; phyllaries 5, 1-seriate, ovate. Corollas yellow to bright orange; ray florets female, 2- or 3-toothed, depending on clone, lamina ca. 12 × 7 mm; disk florets male, ca. 7 mm. Immature achenes purple, turning dark brown or black at maturity. Fl. Jun-Sep.
Native to South America (Bolivia, Colombia, Ecuador, Peru)].

Known as Yacón in South America, this species is an ancient crop of the Andes with tuberous roots that can be eaten raw or cooked.

Smilacina sp. Ruscaceae !

INFO
Common Name: False Solomon's Seal
Perennial Geophyte
Description: A genus embracing nearly a score species of mostly hardy perennials, natives of North and Central America, and temperate and mountainous Asia. Flowers small, on short pedicels; perianth at length deciduous, the segments distinct or shortly connate towards the base; stamens six; inflorescence terminal, shortly pedunculate, racemose or forming a simple panicle; bracts small or obsolete. Leaves alternate, very shortly petiolate, ovate, lanceolate, or rarely narrow. They succeed in any light soil, and may be readily increased by divisions.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=43034 useage as 'accepted'. 2004-07-19.

Smilacina stellata Ruscaceae !

INFO Common Name: little false Solomon's-seal, starflower
Perennial Herbaceous
Native Range: North America
Synonomy: Maianthemum stellatum (L.) Link
Description: Plants terrestrial, 15–45 cm. Rhizomes sympodial, proliferatively spreading, narrow-cylindrical, units 15–60 cm × 3–4.5 mm, roots scattered over surfaces. Stems erect, 2.5–5 dm × 2–3.5 mm. Leaves 8–11, sessile, clasping; blade ovate-elliptic to lanceolate, 5–6 × 2.5–3.5 cm; base rounded; apex acute. Inflorescences racemose, simple, 6–15-flowered. Flowers 1 per node, 3-merous; tepals conspicuous, 4–5 × 1.5–2 mm; filaments 1.2–1.5 mm; anthers 0.6–0.8 mm; ovary globose to cylindrical, ca. 1 mm wide; style 1.3–1.8 mm; stigma obscurely 3-lobed; pedicel 6–12 × 0.8–1 mm. Berries green with black stripes along median carpel vein when young, maturing to red, globose, 4–6 mm diam. Seeds 1–6, globose, 2.5–3 mm. 2n = 36.

Flowering mid or late spring. Sand dunes, marginal woodlands, oak openings; 0–3200 m; Alta., B.C., Man., N.B., Nfld. and Labr. (Nfld.), N.W.T., N.S., Ont., P.E.I., Que., Sask., Yukon; Alaska, Ariz., Calif., Colo., Conn., Del., D.C., Idaho, Ill., Ind., Iowa, Kans., Ky., Maine, Md., Mass., Mich., Minn., Mo., Mont., Nebr., Nev., N.H., N.J., N.Mex., N.Y., N.Dak., Ohio, Okla., Oreg., Pa., R.I., S. Dak., Tenn., Utah, Vt., Va., Wash., W.Va., Wis., Wyo.; disjunct in nw Mexico.

Record Notes: Name checked with IPNI, Jepson Manual, 6/25/2009. Accepted name on GRIN and Flora of North America is Maiantheumu stellata. Sometimes placed in the Ruscaceae or Liliaceae.

Taxon Family Spelling Checked

Smilax glycophylla — Smilacaceae !

INFO
Common Name: Sydney sarsaparilla
Perennial
Native Range: Australia: New South Wales, Queensland
Description: Sydney Sarsaparilla, Smilax glyciphylla, is a native medicinal plant which was widely used by herbalists in Sydney at the end of the 19th century. Sydney Sarsaparilla was claimed it to be superior to official sarsaparilla. A blood purifier, usually taken as a tea. Protected, partially shaded position. Perennial vine, growing to 3m. Also known as Sweet Sarsaparilla
Cultivation: Sarsparilla will grow in light (sandy),medium (loamy),hard (clay) soil. It is not necessary for the soil to be well drained.
The soil prefers the following PH / acid levels :
- pH of less than 6, Acidic soils
- pH between 6 and 8, Neutral soils
- pH greater than 8, Basic soils
Sarsparilla prefers moist soils

Sarsparilla can grow in semi or areas with no shade.

Valleys in humid positions along the coast[152].

Planting places suited to this plant described below.

Grows within a woodland garden
Grows on a sunny edge

Solanum aviculare Solanaceae !

INFO
Common Name: Kangaroo Apple
Perennial Shrub
Height: 6-9ft. Spread: 6-12ft.
Flowers Purple
Native Range: Eastern Australia, New Zealand, Northern Guinea
Potentially Invasive
Description: A fast growing shrub 1-3m x 1- 4m.
Large dark green lobed leaves.
Violet flowers from spring through autumn followed by fruits which are scarlet when ripe.
Can be used as a "fill-in" plant whilst waiting for other species to develop at which time can be removed.
A good screening shrub which can become straggly but will regenerate after pruning.
Aborigines ate very ripe fruit.
Cultivation: Can be used as a "fill-in" plant whilst waiting for other species to develop at which time can be removed.
Record Notes: Name checked with The Plant List on 7/22/2013 by Mona Bourell.

Wild Collected by Taylor Neal-Quedensley; 1 January 2000 Unknown, personal communication betw. Gardener 9 and Taylor. Only information is that it was probably collected in 2000..

Notes

3/12/2014 Marc Johnson: Location 29G removed from database by Marc Johnson on 3/12/2014 Reason: Not found during inventory, 2/20/2014 by Marc Johnson and Patrick Quinn. Location Details at time of removal: Bed: 29G (Mesoamerican Cloud Forest) # Plants: 1 Planting Date: Last Checked: 3/24/2009 Volunteer Kori Dean Location Notes: Behind Stevia microchaeta. Lavender flowers in Dec.

3/12/2009 Mona Bourell: Taylor visited 12/13/2008 with Guatemalan botanist, Mario Veliz who determined the plant in 50G to be Solanum hispidum. That plant has thorns on the trunk, the plant in 29G does not. S. hispidum is being assigned a new accession number, 2009-0197. Location 50G removed from this record.

10/10/2006 Mona Bourell: Established plant in bed 50G. Gardener Bead 9 consulted with Taylor Neal-Quedensley in Aug 06, who confirmed ID, but only information he could add was that it was probably wild collected in 2000.

Taxon Family Spelling Checked

Solanum hispidum — Solanaceae !

INFO
Common Name:
Perennial Shrub
Height: 5ft.
Flowers Purple
Native Range: South America
Synonomy: Solanum rusbyi Britton ex Rusby; Solanum phaeophyllum Werderm.
Description: Small shrub to 3-5ft, noticable for its large, velvety, fuzzy leaves. The trunk and branches can have small thorns, though they aren't particularly prominent. The large leaves grow to several inches. Clustered purple flowers, of the classic Solanaceae look and shape are borne in Spring and Summer. Cherry-tomato sized fruits follow and ripen to a dark purple with grayish green spots. The fruits are probably not edible.

Cultivation: Grow in full sun. Water moderately Once established it is fairly hardy.

Propagation: By seeds. Seeds should be planted in well-drained soil and can be slow to germinate, generally taking several weeks.

Solanum pyracanthum Solanaceae X

INFO
Common Name:
Height: 3'ft.
Flowers Purple
Native Range: Madagascar, Africa
Description: This great looking member of the Solanaceae family was described by Jacquin in 1804. It is found on Madagascar, growing in a well drained soil with some water and some to lots of sun. It will grow up to 150 centimetres in height, and the flowers are lavender in colour.

Taxon Family Spelling Checked

Solanum xanti 'Mountain Pride' Solanaceae !

INFO
Common Name: purple nightshade
Perennial Shrub
Flowers Purple
Description: From San Marcos Growers:
A loosely spreading, semi-deciduous subshrub to roughly 2 feet tall and slightly wider with dark green, 1-inch long oval leaves. Clusters of showy, 1-inch wide, rich purple flowers with bright yellow stamens and a pair of green spots at the base of each petal are borne in winter and spring. 'Mountain Pride' adds vibrant color to perennial borders and is useful in the dry shade beneath coast live oak trees. To promote a bushy habit, prune leggy branches in late summer or fall. Noted at being resistant to deer predation, likely because all parts of this plant are considered poisonous, as are most plants in this family. This selection was made by native plant expert and garden designer Carol Bornstein along Mountain Drive in the Santa Barbara foothills among regrowth following the disasterous 2008 Tea Fire. It was selected for its attractive and particularly dark-purple colored flowers.
Cultivation: Plant in sun to part shade in coastal gardens and shady spots inland. This adaptable native is not fussy about soil type as long as it is relatively well drained. Plants are drought tolerant, needing little to no irrigation once established but will accept modest summer watering. Hardy to at least 20° F.
Record Notes: Name checked with The Plant List on 9/17/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Solanum xanti var. obispoense 'Navajo Creek' Solanaceae

INFO
Common Name: Purple Nightshade
Perennial Shrub
Flowers Purple Apr, May, Jun, Jul
Description: A Native Sons selection of the native nightshade, this low growing evergreen shrub features a dense, spreading habit and abundant dark blue to lavender flowers. It reaches no more than 18" tall and spreads from 3-4' across in well-drained soils with moderate water. In mild climates 'Navajo Creek' will bloom year round.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 11/25/2008.

Perennial Herbaceous
Height: 1ft.
Flowers Purple
Native Range: Swiss Alps
Description: S. alpina is a compact, clump-forming, evergreen perennial with thick, rounded to kidney-shaped, dark green leaves and, in early spring, nodding, funnel-shaped, purple to violet flowers with fringed petals, marked red inside.
Soldanella alpina is: Evergreen

Flower: Purple in Spring

Foliage: Dark-green in All seasons

Habit: Cushion or Mound Forming
Record Notes: Name checked with The Plant List on 8/14/2014 by Mona Bourell.

Solidago canadensis — Asteraceae !

INFO
Common Name: Canada goldenrod
Perennial Herbaceous
Flowers Yellow
Native Range: Calif. - Brit. Col.
Description: Herbage ± sparsely strigose (more so above)
Stems 25–150 cm, rhizomed
Leaves: middle cauline largest, 5–15 cm, ± lanceolate, generally 3-veined, toothed
Inflorescence panicle-like; heads many; involucre 2.5–3.5 mm; phyllaries lanceolate, outer 1/4–1/3 length inner
Ray flowers 8–15; ligules 1.5–2 mm
Disk flowers 5–12; corollas 2.5–3.5 mm
Fruit 1–1.5 mm, ± strigose
Chromosomes: 2n=18,36
Ecology: Meadows, thickets
Elevation: < 2800 m.
Bioregional distribution: Northwestern California, Cascade Range, Sierra Nevada, Central Western California, Great Basin Floristic Province
Distribution outside California: to British Columbia
Record Notes: Name checked with TROPICOS, Jepson Manual, 4/27/2010.

Taxon Family Spelling Checked

Solidago elongata — Asteraceae !

INFO
Common Name: goldenrod
Perennial Herbaceous
Flowers Yellow
Native Range: B.C., CA, ORE, WASH
Synonomy: Solidago canadensis Linnaeus subsp. elongata (Nuttall) D. D. Keck; S. caurina Piper; S. elongata var. microcephala Kellogg; S. lepida de Candolle var. caurina (Piper) M. Peck; S. lepida var. elongata (Nuttall) Fernald
Description: Plants 25–150 cm; rhizomes short to long creeping, forming few- to many-stemmed clones. Stems 1–20+, erect, proximally sparsely to moderately strigoso-villous, distally usually moderately to densely so. Leaves: basal 0; proximal cauline sessile, blades narrowly to broadly oblanceolate, 35–75(–100) × (6–) 7.5–14(–20) mm, proximal much smaller, tapering to bases, margins subentire or finely serrulate to coarsely, sharply serrate (teeth 0–9 per side), ciliate, 3-nerved, sometimes obscurely so, apices acute, abaxial faces glabrate to sparsely short-strigose, adaxial glabrous; mid to distal cauline sessile, blades oblanceolate, becoming lanceolate distally, 20–60 × 4–8(–11) mm, largest near mid stem, somewhat to much reduced distally, margins entire or finely serrulate, rarely serrate (teeth 1–8 per side), usually becoming entire to sparsely serrulate distally, ciliate, apices acute, faces glabrous or sparsely strigoso-villous, more so along abaxial nerves. Heads 12–500+, sometimes secund, in short to long, thyrsiform or narrowly secund-pyramidal paniculiform arrays, usually congested, club-shaped to rarely wand-shaped, (2.5–) 10–20 × (2–)4–8(–10) cm, branches usually ascending or sometimes arching spreading. Peduncles 2–7 mm, sparsely to moderately short strigoso-villous; bracteoles 1–3 , linear, rarely minutely stipitate-glandular. Involucres narrowly campanulate, 2.5–3.5(–4) mm. Phyllaries in 3–4 series, strongly unequal, margins sparsely long ciliate, acute, faces glabrous, rarely sparsely minutely stipitate-glandular; outer lanceolate, inner linear-lanceolate. Ray florets (8–)11–15(–17); laminae 1–2.5 × 0.1–0.4(–0.7) mm. Disc florets (3–)5–11(–16); corollas 2.6–3.7(–4) mm, lobes 0.5–1.2 mm. Cypselae (narrowly obconic) 1–1.5 mm, sparsely to moderately strigose; pappi 2.5–3.3 mm. 2n = 18, 36.

Flowering Aug–Oct. Sandy, gravelly soils, coastal

Notes
10/21/2010 Mona Bourell — This plant is now blooming in 40A and Terry determined it to be S. spathulata and matches it with acc. 1991-0871. Last checked here [one clump NE edge of bed; #31 on bed inventory map], one on 6/4/2010 by Mona and Terry during bed inventory. So this record is being deaccessioned.

Solidago spathulata — Asteraceae !

INFO
Common Name: coast goldenrod
Perennial Herbaceous
Native Range: central & north coastal California
Description: Plant ± glabrous (except inflorescence)
Stems 1–5 dm, decumbent to erect, from short, woody caudex
Leaves glabrous, generally resinous-sticky; lower largest, 5–10 cm, spoon-shaped, crenate, obtuse; upper reduced, entire, acute
Inflorescence wand- to club-like, strigose; heads few–many; involucre 4–7 mm; phyllaries very resinous-sticky, outer ovate, inner narrowly lanceolate
Ray flowers 4–10; ligules 2.3–4 mm
Disk flowers 10–18; corollas 4.3–6 mm
Fruit 2–3 mm, strigose
Chromosomes: 2n=18
Ecology: Dunes, headlands
Elevation: < 100 m.
Bioregional distribution: North Coast, Central Coast
Cultivation: Information from the Jepson Horticultural Database for Solidago spathulata:

Given excellent drainage (modification of compacted or other water-holding soils may be necessary), moderate summer watering, and full or nearly full sun (tolerates summer afternoon sun), grows especially well in zones 5, 14, 15, 16, and 17 and also in zones 19, 20, 21, 22, 23, and 24.

Record Notes: Name checked with TROPICOS, 10/21/2010.

8/23/2012 Mona Bourell — Location 48A removed from database by Mona Bourell on 8/23/2012 Reason: Not found during inventory, 8/22/2012 by MB & TS . Location Details at time of removal: Bed: 48A (Redwood Trail) # Plants: ~4 Planting Date: Last Checked: 1/12/2005 Tony Morosco Location Notes: slated for removal once established in Med. collection. Location ID: 3622. Record

12/21/2009 Olivier Thériault — Not found in Bed 0B3. 8 plants last checked 10/17/2006 by Jeanne Rich. Notes: 5- 5 gal, 3- 6". Location removed 12/21/2009.

7/25/2007 Mona Bourell — Jason found one potted plant in 71. It looks not too healthy. It is being returned to nursery [0B3].

10/17/2006 Mona Bourell — Jeanne reports one dead in 0B3, 10/17/2006. Qty reduced from 8 to 7.

5/31/2006 Tony Morosco — Saw at least one plant in bed 11A, unknown planting date. Probably planted out by gardener Jason Martinez from those listed in bed 0B3.

10/18/2005 Tony Morosco — Consolidated location for plants in nursery. previously listed as 2 in 0B3 and 1 in 0B2. Now 5 5 gallon plants and 3 6 inch plants in bed 0B3.

1/12/2005 Tony Morosco — Don Mahoney showed where plants of a Sonchus from Canary Islands was in bed 48A. Terry made a division which has been transfered to Jeanne for propagation. New plants to be used in Mediterranean collection, eliminate old plants from bed 48A when established in Med. collection. Updated location and accession record. Found that Sonchus abbreviatus = Sonchus

Taxon Family Spelling Checked

Sophora chrysophylla Fabaceae !

INFO Common Name: mamani
Perennial Tree
Height: 50ft.
Flowers Yellow
Native Range: USA: Hawaii
Synonomy: Sophora chrysophylla var. elliptica, Sophora chrysophylla var. glabrata, Sophora chrysophylla var. grisea, Sophora chrysophylla var. kanaioensis, Sophora chrysophylla var. kauensis, Sophora chrysophylla var. lanaiensis, Sophora chrysophylla var. makuaensis, Sophora chrysophylla var. ovata, Sophora chrysophylla var. unifoliata, Sophora chrysophylla ssp. circularis, Sophora chrysophylla ssp. glabrata, Sophora chrysophylla ssp. unifoliata
Edwardsia chrysophylla Salisb.
Description: Sophora chrysophylla is a large shrub or medium sized tree up to 50 feet tall. The branches are golden brown with ridges running along them. Each leaf consists of 6 to 10 pairs of oval leaflets. The light green leaflets range in size from 3/8 to 2 inches long and 1/4 to 1 inch wide.
The pea-like yellow flowers form loose bunches at the bases of leaves or the ends of branches. Flowering occurs in winter and spring.

Propagation: Propagation by Seeds
The seeds of Sophora chrysophylla are contained in winged, woody pods shaped like strings of beads - the pods narrow between each seed. Culliney et al notes that the pods stay attached to the tree for most of the year. These brown or brownish gray pods can be up to 6 inches long and are generally 1/2 inch wide. Wagner reports that the seeds are brown to grayish black; both Culliney and Lamb describe them as yellow or orange. Each flattened oval seed is about 1/4 inch long.

In his germination studies, Obata found that untreated seeds of Sophora chrysophylla had germination rates of less than 5%.

Culliney et al recommends scarification followed by soaking the seeds in water for 24 hours and reports germination times of 1 to 2 weeks. Scarification (penetration of the seed coat) can be done using a clippers, file or sandpaper, or by cracking the seeds with a hammer being careful not to damage the end

5/21/2009 Mona Bourell: Not found in APG during inventory 2008-2009. Last checked in old ambiguous bed 67, one in 1995. Location removed.

10/7/2004 Geoff Smick: 1 plant brought up from nursery for Asian Discovery planting but unused. Supposed to be returned to nursery, hopefully to bed 0C2 where it came from but unsure. Not changing qty. or location for now.

9/16/2004 Geoff Smick: Homonym exists. Check this!

Potted 9/10/98.

Sophora flavescens Fabaceae !

INFO Common Name:
Perennial Herbaceous/subshrub
Native Range: China
Description: Herbs or subshrubs, 1-2 m. Stem striped, pilose when young. Leaves 20-25(-30) cm; stipules lanceolate, 6-8 mm, acuminate; leaflets 13-25, elliptic, ovate, or lanceolate, 3-4(-6) × (0.5-)1.2-2 cm, papery, pilose or glabrescent abaxially, gla-brous adaxially, base cuneate or slightly cordate, apex obtuse or acute. Racemes terminal, 15-25 cm. Flowers many, widely spaced; pedicel slender, ca. 7 mm; bracts linear, ca. 2.5 mm. Ca-lyx campanulate, oblique; teeth not obvious, sparsely pubes-cent. Corolla white, pale yellow, purple-red, or red; standard obovate-spatulate, 14-15 × 6-7 mm, apex rounded or retuse, narrowing to a claw; wings rugose, claw equal to blade, ca. 13 mm; keel similar to wings, slightly broader, ca. 4 mm wide. Stamens 10, free or slightly fused at base. Ovary nearly ses-sile, hairy; ovules many; style slightly curved. Legumes 5-10 cm, slightly constricted between seeds, slightly quadrangular, sparsely or densely pubescent or glabrescent, 4-valvate. Seeds 1-5, red-brown or purple-brown, long ovoid, slightly com-pressed. Fl. Jun-Aug, fr. Jul-Oct.
Scrub, hill slopes, farm fields; below 1500 m. All provinces [India, Japan, Korea, Russia].

Sophora godleyi

Fabaceae !

INFO
Common Name: kōwhai
Perennial Tree
Flowers Yellow
Native Range: New Zealand
Description: Sophora godleyi is commonly known as kōwhai, godleys kōwhai or papa kōwhai and grows naturally in the west of the North Island from Te Kuiti to the Manawatu in New Zealand.

S. godleyi has a weeping habit and can grow to height of about 25 metres.

There is a profusion of yellow flowers around October/November making it one of the finest of New Zealand's native trees

1/9/2009 Olivier Thériault — 1 plant found in bed 0B3. Was previously in bed 0C2. Presumed is same plant as one previously found in bed 0L9. Location changed from bed 0L9 to 0B3. Dolores Gomez wanted to plant it in Temperate Asia but plant is from New Zealand/Tasmania.

9/22/2008 David Kruse-Pickler — 1 plant found in bed 0L9. Location record changed from 0L5 to 0L9.

9/4/2007 Mona Bourell — Jeanne found one in 0C2 during inventory 8/20/2007. Qty reduced from 3 in 11/10/2006, to one now.

8/29/2007 David Kruse-Pickler — Returned to nursery from Rhody staging area due to it's origins (New Zealand). Double checking to see if they were returned to above beds.

Taxon Family Spelling Checked

Sophora longicarinata Fabaceae !

INFO
Common Name: limestone kōwhai
Perennial Shrub/tree
Height: 10-16ft.
Flowers Yellow
Native Range: New Zealand
Synonomy: Sophora microphylla var. longicarinata
Description: Sophora longicarinata is commonly known as kōwhai or limestone kōwhai that grows naturally in a limited range around northern Nelson and also western Marlborough in New Zealand.[1] This species has quite small leaves compared to other similar species. Originally classified as a species in 1942 and then merged with Sophora microphylla it was reclassified as its own species again in 2001.[2] As its common name suggests it grows in limestone areas. This species does not have a divaricating juvenile phase

Small, graceful weeping tree with fine dainty foliage and greenish-yellow large flowers. No tangled juvenile phase. Flowers and nectar from September-November [in NZ]. Semi-deciduous. Hardy.

Record Notes: Name checked with Tropicos on 4/3/2014 by Mona Bourell. In The Plant List as a synonym of S. microphylla var. longicarinata

Sophora tetraptera Fabaceae !

INFO
Common Name: Kowhai, Pelu
Perennial Tree
Height: 20-30ft.
Flowers Yellow
Native Range: New Zealand, Chile
Description: A small to medium, evergreen tree, growing to 15–39 ft (4.6–12 m). The much-divided (pinnate) green leaves are 3–6.3 in (7.5–16 cm) long. The yellow flowers are up to 2.2 in (5.7 cm) long; spring to summer.

Sophora tetraptera is found in forest edges in North Island, New Zealand. It is commonly called kowhai, its Maori name.

Cultivation: Grows best in areas with long, hot summers.

Record Notes: Name checked with The Plant List on 4/5/2012 by Mona Bourell.

Taxon Family Spelling Checked

Sorbus alnifolia — Rosaceae !

INFO
Common Name: Korean mountain ash
Perennial Tree
Height: 40-50ft. Spread: 20-25ft.
Flowers White
Native Range: China, Taiwan, Japan, Korea
Description: Trees to 20 m tall. Branchlets dark reddish brown when young, dark grayish brown when old, terete, puberulent when young, glabrous when old, with white lenticels; buds ovoid, 4–7 mm, apex acute; scales several, dark reddish brown, glabrous. Leaves simple; petiole 1.5–3 cm, glabrous or slightly puberulent; leaf blade ovate to elliptic-ovate or suborbicular, 5–10 × 3–6 cm, lateral veins 6–10(–14) pairs, nearly parallel and terminating in marginal teeth, raised abaxially, both surfaces glabrous or abaxially puberulent along veins, base broadly cuneate to rounded, margin irregularly sharply doubly serrate or lobed, apex shortly acuminate. Compound corymbs terminal, 4–8 cm in diam., loosely 6–25-flowered; rachis and pedicels sparsely pubescent. Pedicel 6–12 mm. Flowers 1–1.4(–1.8) cm in diam. Hypanthium campanulate, abaxially glabrous. Sepals triangular or triangular-ovate, apex acute. Petals white, suborbicular to oblong-ovate, 5–7 × 3.5–6 mm, base clawed, apex obtuse. Stamens 20; filaments white, slightly shorter than petals. Ovary 2-loculed; styles 2, not exceeding stamens, glabrous, connate basally. Fruit red, oblong, ovoid-oblong, or globose, 1–1.4 cm × 7–10 mm, without or with few minute lenticels, sepals caducous, leaving a small annular scar; seeds pale brownish orange, linear-oblong. Fl. Apr–May, fr. Aug–Sep.
Native habitat:
Slopes, gullies, mixed forests, thickets; 500–2300 m. Anhui, Fujian, Gansu, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Zhejiang [Japan, Korea].

1 Leaf blade ovate to elliptic-ovate, margin usually not lobed, irregularly doubly serrate; fruit oblong or ovoid-oblong, rarely subglobose. 48a var. alnifolia
+ Leaf blade orbicular-ovate, or suborbicular, margin usually lobed, doubly serrate; fruit ovoid-oblong or globose. (2)

2 (1) Fruit ovoid-oblong, rarely subglobose. 48b var.

Taxon | Family Spelling Checked

Sorbus corymbifera — Rosaceae !

INFO
Common Name:
Perennial Tree
Flowers White
Native Range: China, SE Asia
Synonomy: Pyrus granulosa Bertoloni; Vaccinium corymbiferum Miquel, Fl. Ned. Ind., Eerste Bijv. 588. 1861; Aria corymbifera (Miquel) H. Ohashi & H. Iketani; Micromeles corymbifera (Miquel) Kalkman; M. granulosa C. K. Schneider; Photinia bartletti Merrill; Sorbus granulosa (Bertoloni) Rehder.

Description: Trees, rarely shrubs, to 18 m tall. Branchlets brown when young, blackish brown when old, terete, rusty brown tomentose when young, glabrate; buds ovoid, 6–8 mm, apex acute; scales brownish, glabrous. Leaves simple; petiole 2.5–3 mm, rust-brown tomentose when young, glabrescent; leaf blade ovate or elliptic-ovate, 9–13 × 4.5–6 cm, lateral veins 7–11 pairs, slightly curved and anastomosing toward margin, both surfaces rusty brown tomentose, glabrate, base rounded, margin shallowly crenate, apex acuminate. Inflorescences 4–7 × 3–5(–6) cm, many flowered; rachis and pedicels rusty brown tomentose, glabrous when old, small lenticellate. Pedicel 3–4 mm. Flowers 6–7 mm in diam. Hypanthium initially rust-brown tomentose, glabrate. Sepals triangular, 1.5–2.5 × 2–3 mm, apex acute. Petals white, ovate, 3–4 × 2–3 mm, adaxially puberulous, apex obtuse. Stamens 20(–25), nearly as long as or somewhat shorter than petals. Styles (2 or)3 or 4, not exceeding stamens, glabrous, connate near base. Fruit reddish brown, globose to ovoid-globose, 1–1.5(–2) cm in diam., 2–4-loculed, with rusty lenticels, conspicuously marked by an annular scar. Fl. Jan–Feb, fr. Aug–Sep.
Native habitat: Moist mixed forests; 1200–3400 m. Guangdong, Guangxi, Guizhou, Hainan, Hunan, Yunnan [Cambodia, Indonesia, E India, Laos, N Myanmar, Thailand, SE Vietnam].

Record Notes: Originally in record as Pyrus granulosa Bertolon which is a synonym according to Flora of China and TROPICOS, 6/29/2010.

ACCESSION

Native Range: China
Description: Shrubs or small trees, 5–8 m tall. Branchlets dark purple when young, purplish brown to blackish brown when old, slightly cottony-hairy when young, glabrous when old, with conspicuous grayish white oblong lenticels; buds ovoid, (0.8–) 1–1.5(–2) cm, apex ± obtuse; scales brown, suborbicular or broadly ovate, glabrous. Leaves simple; petiole to 1.8 cm, glabrous; leaf blade grayish green abaxially, light green adaxially, elliptic-obovate or obovate-elliptic, 10–18 × 5–9 cm, lateral veins 14–20 pairs, nearly parallel and terminating in marginal teeth, raised abaxially and impressed adaxially, both surfaces glabrous or abaxially cottony-hairy in vein axils, base cuneate to subrounded, margin crenate-serrate or lobed, apex acuminate. Compound corymbs terminal on branchlets, 4–7 × 9–13 cm, many flowered; rachis and pedicels cottony-hairy, subglabrous when old, with conspicuous lenticels. Pedicel 5–8 mm. Flowers 5–8 mm. Hypanthium campanulate, abaxially tomentose. Sepals triangular, ca. 2 mm and ca. as broad, apex acute. Petals broadly ovate or suborbicular, ca. 3 mm and ca. as broad, apex obtuse. Stamens 20, ca. 3.5 mm. Styles 3 or 4, connate at base, ca. as long as stamens, glabrous. Fruit dark reddish brown, ovoid, ovoid-globose, or subglobose, (1.5–)2–3 × (1–) 1.5–2 mm, 3- or 4-loculed, with dense rusty lenticels, with persistent revolute sepals; seeds brown, obovoid, compressed, 4–6 mm. Fl. Apr–May, fr. Jul–Aug.

Mountain valleys, river sides, stream sides, rocky forests on slopes, cliffs; 1200–2700 m. Guangxi, Guizhou, Hubei, Hunan, Sichuan, N Yunnan.

1 Leaf petiole 1–1.8 cm, blade cuneate to subrounded at base; fruit ovoid or ovoid-globose, 1.5–2 cm in diam.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Taxon Family Spelling Checked

Sorbus microphylla Rosaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China: Yunnan
Description: Shrubs or small trees, 2–5 m tall. Branchlets reddish brown when young, grayish brown when old, terete, puberulous when young, with sparse, oblong or suborbicular lenticels; buds conical or ovoid, 5–7(–8) mm, apex acuminate and puberulous; scales several, reddish brown. Leaves imparipinnate, together with rachis 11–14 cm; petiole 1–1.5 cm; stipules lanceolate or subulate-lanceolate, 4–6 mm, submembranous, margin entire or slightly 2-lobed; rachis slender, adaxially grooved with reddish glands at base of leaflet, ± brown puberulous, glabrous when old, narrowly winged; leaflet blades 10–17(–19) pairs, at intervals of 5–8 mm, pale abaxially, dark green adaxially, linear-oblong, 0.7–1.5(–2) cm × 4–8 mm, both surfaces glabrous, or abaxially with brown hairs only along midvein when young, base obliquely rounded, margin sparsely sharply serrate, apex obtuse or acute. Compound corymbs terminal, 2–4(–6) cm, laxly flowered; rachis and pedicels glabrous, rarely brown puberulous; bracts narrowly lanceolate, smaller than stipules, submembranous. Pedicel 6–9 mm. Flowers 7–10 mm in diam. Hypanthium dark purplish black, broadly campanulate, 2–3 mm, glabrous. Sepals triangular, 1.5–2 mm, apex acute, rarely ± obtuse. Petals pink, suborbicular, 3–4 mm, glabrous, base shortly clawed. Stamens ca. 20, slightly shorter than petals; filaments rose; anthers nearly purplish black. Styles 5, ca. as long as stamens, pubescent basally. Fruit white or flushed pink or crimson, globose or ovoid, 8–10(–12) mm in diam., glabrous, without lenticels, with persistent erect sepals; seeds blackish, oblong-ovoid, 3–4 mm. Fl. May–Jun, fr. Sep–Oct.

Forests or shrubby thickets in valleys or along river banks; 3000–4000 m. E Xizang (Gongbo'gyamda Xian), NW Yunnan [Afghanistan, Bhutan, NE India, N Myanmar, Nepal, Pakistan, Sikkim].

This taxon is probably an aggregate of apomictic microspecies derived partly from Sorbus rufopilosa and, in China, partly from hybrids and back-crosses between the apomictic, tetraploid S. filipes and the diploid S. rehderiana and S. monbeigii.

Sorbus reducta — Rosaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China: Yunnan
Description: Shrubs dwarf, 15–60 cm tall. Branchlets brownish gray to brownish black, terete, with white and brown hairs when young, gradually glabrescent; buds ovoid, 4–8 mm, apex acute to shortly acuminate; scales several, reddish brown, apically white and reddish brown pubescent. Leaves imparipinnate, together with rachis 6–8 cm; petiole 1–2 cm; stipules linear-lanceolate, 5–7 mm, submembranous; rachis sulcate, slightly winged, sparsely pubescent when young, glabrate; leaflet blades 4–6-paired, at intervals of 6–10 mm, oblong-elliptic or oblong, 1–2 cm × 6–10 mm, abaxially glabrous, adaxially sparsely appressed villous, glabrous or subglabrous when old, base obliquely rounded, margin minutely sharply serrate, entire only at base, apex obtuse or acute. Inflorescences corymbose or compound corymbose, (2–)3–6 × 3–5 cm, few flowered; rachis and pedicels white pubescent, intermixed with few reddish brown hairs; bracts linear-lanceolate, 4–6 mm. Pedicel 1–2 mm. Flowers 6–7 mm in diam. Hypanthium campanulate, abaxially glabrous or reddish brown pubescent. Sepals triangular, 1.5–2.5 mm, apex obtuse. Petals white, ovate or broadly obovate, 3–5 × 3–4 mm, puberulous, apex obtuse, rarely somewhat emarginate. Stamens 20, ca. 1/2 as long as petals. Styles 3–5, equalling or lower than stamens, pubescent basally. Fruit white, globose, 6–8 mm in diam.; sepals persistent. Fl. May–Jun, fr. Sep–Oct.

Thickets on mountain slopes, mixed woods, stony mountain valleys, scrub, grasslands; 2200--4000 m. SW Sichuan, NW Yunnan.

Hypanthium glabrous abaxially.

Sphaeralcea ambigua var. ambigua — Malvaceae !

INFO
Common Name: apricot mallow
Perennial Shrub
Flowers Red-orange to apricot
Native Range: S. California
Description: Plant canescent
Stem erect, 5–10 dm
Leaf: blade 15–50 mm, ± triangular, weakly 3-lobed, green or yellow-green, 3-veined, base wedge-shaped, truncate, cordate, margin crenate, wavy
Inflorescence: tip not leafy
Fruit: segments 9–13, < 6 mm, < 3.5 mm wide, truncate-cylindric, dehiscent part < 3.5 mm, rounded, 60–75% of segment
Seeds 2 per segment, brown, glabrous, ± hairy
Ecology: Desert scrub
Leaf not markedly wrinkled
Inflorescence open, sometimes raceme-like; flowers in clusters or solitary
Flower: petals red-orange to apricot; filament tube 3–9 mm, hairy, anthers yellow-purple
Fruit: dehiscent portion ± 60% of segment
Ecology: Habitat and range of sp
Elevation:
Bioregional distribution: s East of Sierra Nevada, Desert
Flowering time: Feb–Jul
Synonyms: var. monticola (Kearney) Kearney; S. parvifolia Nelson misapplied to CA plants

Cultivation: Information from the Jepson Horticultural Database for Sphaeralcea ambigua var. ambigua:

Given excellent drainage (modification of compacted or other water-holding soils may be necessary), absence of frequent summer water (distance from water-loving plants), and full or nearly full sun (tolerates summer afternoon sun), grows especially well in zones 7, 8, 9, 10, 11, 12, 14, 18, 19, 20, 21, 22, and 23 and also in zones 2, 3, 13, 15, 16, 17, and 24.

Spiraea canescens — Rosaceae !

INFO
Common Name:
Perennial Shrub
Flowers White to pinkish May, Jun
Native Range: Himalayas - China
Synonomy: Spiraea flagelliformis - Hort.
Spiraea rotundifolia - Lindl.
Description: Shrubs 2–4 m tall. Branches tortuous; branchlets brown or gray-brown, angled, pubescent when young, later glabrescent; buds long ovoid, with 2 brown scales, pubescent, apex acute to shortly acuminate. Petiole 2–4 mm, pubescent; leaf blade ovate or obovate to obovate-lanceolate or oblong, 1–2 × 0.8–1.2 cm, abaxially pubescent, sometimes subglabrous or glabrous, adaxially often glabrous, base cuneate, margin entire or obtusely 3–5-dentate above middle, apex obtuse, sometimes inconspicuously 3-lobed. Corymbs terminal, compound, 2–4.5 × 3–5 cm, many flowered; rachis and pedicels densely pubescent; pedicels 4–8 mm; bracts linear, 2–4 mm, pubescent. Flowers 5–6 mm in diam. Hypanthium campanulate, pubescent abaxially. Sepals triangular, 2–2.5 mm, erect or spreading in fruit, apex acute. Petals white or pinkish, suborbicular, 2–3.5 × 2–3 mm, glabrous, base shortly clawed, apex entire or emarginate. Stamens ca. 20, subequaling to slightly longer than petals. Disk annular, 10-lobed; lobes broad, apex emarginate. Carpels slightly pubescent; styles shorter than stamens. Follicles slightly spreading, glabrous to pubescent or pilose; styles on abaxial side, divergent. Fl. Jul–Aug, fr. Sep–Oct.

Thickets, thicket margins, valleys, river banks, stream sides, dry places; 2300–4000 m. Gansu, W Sichuan, E and S Xizang, NW Yunnan [Bhutan, N India, Nepal, Sikkim].

Cultivation: It is hardy to zone 5. It is in flower from July to August, and the seeds ripen from September to October. The flowers are hermaphrodite (have both male and female organs) and are pollinated by insects. The plant prefers light (sandy), medium (loamy) and heavy (clay) soils. The plant prefers acid, neutral and

Taxon | Family Spelling Checked

Spiraea mollifolia — Rosaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs to 2 m. Branchlets brown to red-brown, conspicuously angled, villous initially, later glabrescent; buds ovoid-lanceolate, 5–7 × 3–4 mm, with 2 red-brown scales, pubescent when young, apex long acuminate. Petiole 2–6 mm, pubescent; leaf blade oblong, elliptic, rarely obovate, 1–2 × 0.4–0.8 cm, sericeous-villous on both surfaces or subglabrous to glabrous abaxially, base cuneate, margin entire or with a few obtuse teeth apically, apex obtuse or acute. Racemes pedunculate, umbellate, 2–4 × 1.5–3 cm, 10–18-flowered; rachis and pedicels villous or pilose; pedicels 4–8 mm; bracts narrowly oblong or linear, 2–4 mm, villous on both surfaces, margin entire, apex shortly acuminate. Flowers 5–7 mm in diam. Hypanthium campanulate, glabrous to villous abaxially, sometimes pilose. Sepals triangular, 1.5–2.5 × 1.5–2 mm, erect in fruit, apex acute. Petals white, suborbicular, 2–3 mm, about as broad as long, apex obtuse. Stamens ca. 20, nearly equaling petals. Disk annular, 10-lobed; lobes broadly orbicular. Styles shorter than stamens. Follicles straightly spreading, pubescent; styles subterminal on abaxial side. Fl. Jun–Aug, fr. Jul–Oct.
Forests, forest margins, thickets, mountain valleys, subalpine meadows, slopes, river banks; 2600–4400 m. Gansu, Guizhou, Shaanxi, Sichuan, Xizang, Yunnan.

Leaf blades abaxially, inflorescences, and hypanthium abaxially

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Spiraea myrtilloides — Rosaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs 2–3 m tall, much branched. Branchlets red-brown to dark brown, angled, sparsely villous or subglabrous; buds ovoid, 3–4 mm, with several brown scales, glabrous or subglabrous, apex acute. Petiole 1–2 mm, glabrous or subglabrous; leaf blade abaxially greenish, ovate to ovate-oblong or obovate-oblong, 6–15 × 4–7 mm, abaxially sparsely pubescent or glabrous, adaxially glabrous, inconspicuously pinnately veined, prominently 3-veined basally, base cuneate, margin entire or with ca. 3 obtuse teeth near apex, apex obtuse, rarely acute. Racemes umbellate, 2–4 × 2–3.5 cm, 7–20- or more flowered; rachis and pedicels glabrous or sparsely pubescent; pedicels 3–8 mm; bracts linear or lanceolate, 2–3 mm, glabrous. Flowers 5–6 mm in diam. Hypanthium campanulate, glabrous or subglabrous abaxially. Sepals triangular, 1–1.5 mm, erect or spreading in fruit, apex acute. Petals white, suborbicular, 2–3 mm, about as broad as long, glabrous, base shortly clawed, apex obtuse. Stamens ca. 20, equaling petals. Disk annular, 10-lobed. Carpels puberulous; styles shorter than stamens. Follicles straightly spreading, glabrous, puberulous only on adaxial suture, or densely pubescent throughout; styles terminal, divergent. Fl. Jun–Jul, fr. Aug–Sep.
Mixed forests, open forests, valleys, slopes, shady places; 1500–3100 m. Gansu, Henan, Hubei, Jiangxi, Qinghai, Shaanxi, Sichuan, Xizang, Yunnan.
Follicles glabrous or puberulous only on adaxial suture.

Spiraea nipponica 'Snowmount' Rosaceae !

INFO

Common Name:
Perennial Shrub
Height: 2-4ft.
Flowers White
Description: This spirea cultivar is a dense, upright, compact, mounded deciduous shrub which typically grows to 2-4' tall with a similar spread. Profuse white flowers in small corymbs cover the arching stems of this plant in late spring. Flowers and leaves all appear on the same side of the arching branches. Flowers are attractive to butterflies. Narrow, dark blue-green foliage. A Royal Horticutural Society of Great Britain Award of Garden Merit plant.

Cultivation: Easily grown in average, medium, well-drained soil in full sun to part shade. Tolerates a wide range of soils. Prune in late winter to early spring.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 3/9/2010.

Spiraea thunbergii Rosaceae !

INFO
Common Name: Thunberg's meadowsweet
Perennial Shrub
Native Range: China+Japan
Description: Shrubs to 1.5 m. Branches spreading, arching, slender; branchlets brown to red-brown, angled, pubescent at fist, finally glabrous; buds ovoid, very small, with several scales, glabrous or puberulous. Petiole 1–2 mm, pubescent; leaf blade linear-lanceolate, 25–40 × 3–7 mm, glabrous on both surfaces, pinnately veined, base narrowly cuneate, margin sharply serrate above middle, apex long acuminate. Umbels sessile, with clustered leaves at base, 10–18 mm, 3–7-flowered; pedicels slender, 6–10 mm, glabrous. Flowers 6–8 mm in diam. Hypanthium campanulate, glabrous abaxially. Sepals triangular or ovate-triangular, 1.5–2 × 1–1.5 mm, erect or reflexed in fruit, apex acute. Petals white, obovate to suborbicular, 2–4 × 2–3.5 mm, glabrous, base shortly clawed, apex emarginate or obtuse. Stamens 18–20, to 1/3 as long as petals. Disk annular, 10-lobed. Carpels glabrous or puberulous; styles nearly equaling stamens. Follicles spreading, glabrous; styles subterminal, divergent. Fl. Apr–May, fr. Jul–Aug.

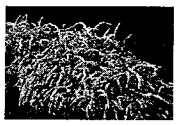

image of 1982 G. Courtwright

Spiraea thunbergii 'Ogon' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft. Spread: 4ft.
Flowers White
Description: 'Ogon's pretty white five-petaled flowers are arranged in abundant clusters along its wiry bare branches. Later, small and slender Willow-like foliage attires the numerous dark twigs. Illuminated in golden shades, this fine textured Japanese selection conveys a bright, wispy visage in the midst of blue flowering Geranium 'Nimbus', Berberis 'Golden Ring' and Euphorbias.

Blooms March–April.

Size: 4' high x 4' wide; hardy to zone 5.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 11/7/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Stachys chrysantha — Lamiaceae !

INFO
Common Name: yellow stachys
Perennial Shrub
Height: 0.25-0.5ft. Spread: 2ft.
Flowers Yellow
Native Range: Greece
Synonomy: Stachys candida subsp. chrysantha (Boiss. & Heldr.) Nyman
Description: From San Marcos Growers:
Stachys chrysantha (Yellow Stachys) - Tuft growing woody-stemmed perennial (sub-shrub) with ascendant white tomentose stems and ½ to 1 inch long broadly ovate to nearly orbiculate, white lanate leaves. The compact spikes of light yellow ½ inch long flowers appear in late spring to summer.
Cultivation: Plant in a sunny location in poor well-drained soil and irrigate infrequently. This plant is considered a calciphile meaning that it likes alkaline soils which makes sense as it is from rocky screes in the mountainous regions of Greece.
Record Notes: Name checked with The Plant List on 8/27/2013 by Mona Bourell.

Stachys lanata 'Silver Carpet' Lamiaceae !

INFO
Common Name: Lamb's Ears
Perennial Herbaceous
Height: 1ft. Spread: 1.5ft.
Flowers n/a
Not Invasive
Description: Large felted, oval leaves are restful to contemplate. Non-flowering. A nice contrast to grasses or colorful, showy plants. 8"x18". This smaller variety only spread 3-4 feet and it does not have a flower bloom. The fuzzy greyish-white leaves form a dense mat that does well as a border or as a contrast to other foliage textures and colors.
Cultivation: Plant in sun or part shade. Only needs occasional watering.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Stachys macrantha 'Morning Blush' Ericaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 16-18 "ft.
Flowers Pink and white
Synonomy: Stachys grandiflora (Steph. ex Willd.) Benth. [Illegitimate]
Description: Origin: Caucasus
Special Features: Dozens of clustered spikes are surrounded with pink-flushed white tubular blooms that look like little horns on short spikes
History: Introduced by JELITTO PERENNIAL SEEDS in 2009
Colour: Pink-flushed, white tubular blooms
Natural Flowering Period: July - August

Growth Habit: Low-growing compact plants
Foliage: Handsome, wrinkled heart-shaped, dark green leaves the entire season
Height with Flowers: 40 cm (16")
Cultivation: Winter Hardiness Zones: Z4-7
Soil Requirements: Well-drained soils, pH 5.5 - 7.8
Location: Full sun or partial shade
Use: Plant in the rock garden, mixed container or the border
Record Notes: Name checked with The Plant List on 9/13/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Stachys macrantha 'Robusta' Lamiaceae !

INFO
Common Name: purple lamb's ear
Perennial Herbaceous
Height: 1-2ft. Spread: 1ft.
Flowers Purple
Synonomy: Stachys grandiflora (Steph. ex Willd.) Benth. [Illegitimate]
Description: 8-12" x 12-15" wide, (division propagated). This sumptuously-colored Asian wildflower is a standout. Dan Hinkley of Heronswood Nursery reintroduced the authentic cultivar several years ago after seeing it bloom in its Turkish habitat.
Stachys macrantha 'Robusta' and 'Superba' had darker purple flowers and were more robust than the species. These cultivars were similar in appearance but 'Superba' was 6 inches taller and bloomed a week later than 'Robusta'. Their dark green leaves remained healthy and ornamental throughout the summer.
Cultivation: Plant in well-drained garden loam with regular irrigation.

Zones 5-9.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 9/13/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Notes

Stachys monieri Lamiaceae !

INFO
Common Name: betony
Perennial Herbaceous
Flowers Purple, Pink Jun, Jul, Aug, Sept, Oct
Native Range: Southern Europe
Synonomy: Stachys densiflora, Betonica monieri
Description: Stachys monieri features basal rosettes of ovate, glossy, dark green leaves and tiny pink to white flowers which appear in dense spikes atop mostly leafless flowering stems rising well above the foliage mat to 1.5-2' tall in late summer. Leaves are evergreen in warm climates, but will depreciate considerably in harsh winters. Although Stachys byzantina (lamb's ears) is grown primarily for its attractive foliage with the insignificant flowering stems being often removed as they appear, the flowers of this species are quite showy and of prime ornamental interest. Synonymous with and sometime sold by nurseries as Stachys densiflora.
Cultivation: Easily grown in average, medium, well-drained soil in full sun. Appreciates some light afternoon shade in hot, humid climates. Soils should be kept evenly moist, but established plants have some drought tolerance. Spreads by creeping stems (stolons) that root as they go along the ground. Plant 12-18" apart for use as a ground cover.
Record Notes: Name changed 06/16/89 by B. Anderson following Flora Europea.

Taxon Family Spelling Checked

Stachyurus chinensis Stachyuraceae !

INFO
Common Name:
Perennial Shrub, deciduous
Flowers Yellow
Description: Shrubs deciduous, 2-4 m tall. Petiole 1-2 cm; leaf blade ovate or oblong-ovate to oblong-elliptic, or suborbicular, 5-12 × 3-7 cm, papery to membranous, abaxially glabrous or sparsely pubescent along midvein and lateral veins, adaxially glabrous, lateral veins 5- or 6-paired, raised on both sides, base usually subcordate, or obtuse, margin crenate-serrate, apex acuminate to shortly caudate-acuminate, or rarely retuse. Spikes 5 -10 cm. Flowers opening before leaves appear, yellow, ca. 7 mm, subsessile or shortly pedicellate; bract triangular-ovate, ca. 3 mm, apex acute; bracteoles ovate, ca. 2 cm. Sepals yellow-green, ovate, ca. 3.5 mm, apex obtuse. Petals ovate, ca. 6.5 mm, apex rounded. Ovary bottle-shaped, puberulous; style ca. 2 mm. Fruit globose, 6-7 mm in diam., glabrous. Fl. Mar-Apr, fr. May-Jul. 2n = 24*.

Forests, thickets, forest margins; 400-3000 m. Anhui, Chongqing, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan, Taiwan, Yunnan, Zhejiang.

This most widely distributed species in the genus is very highly polymorphic in the shape, size, and apices of the leaves. The apices of the leaves are highly variable, but the variation seems to be continuous. The bases of the leaves are usually subcordate, and seemingly the most stable diagnostic character for this species. The plants from Taiwan are more narrowly oblong-elliptic, but show no essential differences from those of Fujian, Guangdong, and Jiangxi. From the subcordate leaf bases of the Taiwan plants, it seems more reasonable to refer them to Stachyurus chinensis than to S. himalaicus. These two species are usually distinguishable by leaf shape, particularly the leaf base, but the plants from SW Sichuan, SE Xizang, and NW Yunnan cannot be distinctly differentiated from those of the Himalayan region. In a broader sense, the two species may be better treated as conspecific.

Flowers Yellow Feb, Mar
Native Range: Himalayas
Description: Shrubs or small trees, 3-5 m tall. Petiole 0.5 -1.5 cm; leaf blade lanceolate to oblong-lanceolate, 8 -13 × 3.5-5.5 cm, papery to thinly leathery, lateral veins 5-7-paired, raised on both sides, base obtuse, margin densely serrulate, apex acuminate to long acuminate. Spikes usually nodding, 5-13 cm, sessile. Flowers yellow, ca. 6 mm, subsessile; bract triangular, ca. 2 mm; bracteoles broadly ovate, apex acute. Sepals broadly ovate, ca. 3 mm, apex obtuse. Petals obovate, ca. 5 × 3.5 mm. Ovary ovoid-oblong, hairy; style ca. 1.5 mm. Fruit subglobose, 7-8 cm in diam., ± glabrous. Fl. Mar-Apr, fr. May-Aug.
Broad-leaved forests, thickets; 400-3000 m. Xizang, Yunnan [Bhutan, N India, N Myanmar, Nepal].

Some plants from NW, SW, and S Yunnan, which had been pre viously referred to Stachyurus brachystachyus , S. himalaicus var. dasyrachis, and S. himalaicus var. microphyllus, respectively, actually belong to S. yunnanensis. As the type gatherings of these names belong to S. himalaicus, they are reduced here to synonymy under that species.

Taxon Family Spelling Checked

Stachyurus praecox — Stachyuraceae !

INFO
Common Name: Spiketail, Kibushi
Perennial Shrub
Height: 20ft.
Flowers Pale yellow Feb, Mar
Native Range: Japan
Description: A native of Japan, Stachyurus praecox is a deciduous shrub which will reach 6-10' (2-3m) tall and about as broad, in Britain and Ireland. The shoots are reddish-brown, shiny and fairly straight. The young flower spikes appear in the leaf axils before the leaves fall in the autumn. In February the spikes begin to develop. In St Andrews the 4-petalled flowers begin to open in mid March. The display will last well into April in our cold and windy exposure. The flowers are quite small, cup-shaped and are creamy-yellow with up to 24 on a stiff, pendulous raceme which is 2 - 3" (5 - 10cm) long.
Stachyurus praecox differs from S. chinensis by its larger broadly elliptic leaves; shoots not arching; slightly shorter racemes; and particularly by its style and stigma which are contained within the flowers
Stachyurus praecox was introduced into cultivation from Japan about 1864 and is illustrated in Curtis's Botanical Magazine t. 6331. Its value as an early flowering shrub has warranted.
Stachyurus praecox is a deciduous shrub that is perhaps best noted for its unique and colorful late winter to early spring flowers that bloom before the foliage emerges. Flower buds form in autumn and overwinter on the plant in pendant, catkin-like racemes that hang from the leaf axils. Each flowering raceme (to 4" long) typically has 10-20 tiny, bell-shaped, 4-petaled, yellow-green flowers (3/ 8" across). Flowers bloom in late March-April in St. Louis. This shrub typically grows to 4-6' (less frequently to 10') tall with an open, upright, arching-spreading habit. During the growing season, attractive red-brown to chestnut-brown branches are clothed (sometimes sparsely) with ovate, tapered, serrate, medium green leaves (to 7" long). Foliage may turn rosy red and yellow in fall. Genus name comes from the Greek words stachys (spike) and oura (tail) in reference to the pendant flower racemes. Plants in this genus are sometimes commonly called spiketail, also in reference to the flowers. Specific epithet means early.

Stachyurus yunnanensis — Stachyuraceae !

INFO
Common Name:
Perennial Shrub, evergreen
Height: 3-9ft.
Flowers Pale yellow to white Feb, Mar
Native Range: China
Description: Shrubs evergreen, 1-3 m tall. Bark dark gray. Petiole 1-2.5 cm, stout; leaf blade elliptic-oblong to oblong-lanceolate, rarely obovate-lanceolate, 7-15 × 2-4 cm, leathery or thinly leathery, both surfaces glabrous, midvein conspicuously raised abaxially, lateral veins 5 -7-paired, inconspicuous on both sides, base cuneate or obtuse, margin serrulate throughout, apex acute, acuminate, caudate-acuminate, or obtuse. Spikes 12 -22-flowered, 3-8 cm; peduncles short, 5-10 mm. Flowers subsessile; bract triangular, ca. 1.5 mm, apex acute; bracteoles triangular-ovate, ca. 2.5 mm, apex acute. Sepals ovate-orbicular, ca. 3.5 mm. Petals yellow to white, obovate-orbicular, 5.5-6.5 × ca. 4 mm, apex obtuse. Ovary bottle-shaped, glabrous; style ca. 6 mm. Fruit globose, 6-7 mm in diam. Fl. Mar-Apr, fr. Jun-Sep. 2n = 24*.

image of © 2008 Mona Bourell, SFBG1999-0138

image of © 2008 Mona Bourell, SFBG1999-0138

Evergreen broad-leaved forests on mountain slopes, thickets at forest margins; 800-1800 m. Chongqing, N Guangdong (Yangshan), SW Guangxi, Guizhou, W Hubei, W Hunan, Sichuan, Yunnan [N Vietnam].

This fairly widely distributed species is characterized by having leaves elliptic-oblong to oblong-lanceolate, and leathery or thinly leathery. Plants from Gongshan, NW Yunnan, have leaves relatively long caudate, and those from Emei Shan, Sichuan, have somewhat larger leaves. Some plants with obovate-lanceolate leaves look very similar to Stachyurus obovatus, and differ only in having relatively shortly caudate, narrower leaves, with their margins serrulate throughout.

The length of the fruit stalk shows some variation between and within populations. However, the difference is so tenuous that it seems not justifiable to describe the plants with somewhat longer fruit stalks as any independent taxonomic entity

Stenocarpus sinuatus — Proteaceae !

INFO
Common Name: firewheeltree
Perennial Tree
Height: 40ft.
Flowers Orange, Red Summer
Native Range: Australia: NSW - Queensland
Description: The firewheel tree takes its name from the configuration and colour of the inflorescences in which the small flowers have a wheel-like arrangement. It is one of Australia's most spectacular trees. S.sinuatus occurs in nature as a tree to about 30 metres but it is usually smaller in cultivation, particularly in cooler areas. The dark, glossy green leaves may be entire or lobed and up to 450 mm long. The conspicuous flower clusters are seen in summer through to autumn.

Despite its sub-tropical to tropical origin, S.sinuatus is adaptable to a range of climates and will even succeed in dry climates if additional water is available. It prefers fairly rich, loamy soils but is tolerant of most well drained soils. It may be grown in a sunny or partly shaded location.
Cultivation: Timber is suitable for cabinet work. The tree is subject to borers. Makes an excellent container plant for indoor use. Flowers attract nectar-feeding birds.
Propagation: From seed, sown fresh, germinates within a month with high % rate. Cuttings are difficult to strike
Record Notes: Name checked with The Plant List on 5/27/2014 by Mona Bourell.

Stephanandra incisa Rosaceae !

INFO Common Name: Lace shrub, Cutleaf Stephanandra
Perennial Shrub
Height: 3-6ft. Spread: 5-7ft.
Flowers White Apr
Native Range: Japan, Korea
Description: Cutleaf Stephanandra is a medium to large deciduous shrub that may be used in various ways in landscapes. The flowers are greenish white and rather small.

Much-branched shrub with slender terete nearly glabrous branchlets; leaves broadly deltoid-ovate, slightly pilose to nearly glabrous, caudately acuminate, whitish green beneath, pinnately cleft to lobed and toothed, 3-6 cm. long, 2-3.5 cm. wide, the petioles 4-8 mm. long; stipules linear to broadly lanceolate, ascending, 1.5 7 mm. long; inflorescence paniculate, terminal on young branches, 2-5 cm. long, many-flowered; flowers creamy white, 4-5 mm. across; bracts caducous, broadly linear; petals slightly longer than the calyx; fruiting carpels globose, short-pubescent, about 2 mm. long; seeds shining, about 1.5 across.
Cultivation: prefers partial shade or partial sun to full sun; soil should be moist.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=565543 useage as 'accepted'. 2004-07-19.

Stephanomeria cichoriacea Asteraceae !

INFO Common Name:
Perennial Shrub
Flowers Pink
Native Range: Southern California
Description: Perennial from large root crown, 5–15 dm
Stems ± tomentose
Leaves: basal in a well developed rosette, 5–18 cm, oblong-lanceolate, entire or with a few teeth, densely tomentose when young; cauline gradually reduced upward
Inflorescence: heads short-peduncled from upper axils or in long terminal and axillary racemes or panicles; involucre 12–15 mm; phyllaries many, graduated in several series
Flowers 10–15; ligules 15–20 mm, pink
Fruit ± 3 mm, weakly 5-angled, smooth; pappus plumose throughout, brownish
Chromosomes: 2n=16
Ecology: Dry rocky slopes
Elevation: 0–2100 m.
Bioregional distribution: South Coast Ranges, South Coast, Channel Islands, Transverse Ranges

Record Notes: Name checked with Jepson Manual, 11/28/2007.

Notes

Stephanotis floribunda 'Variegata' Asclepiadaceae !

INFO
Common Name: Variegated Madagascar Jasmine
Perennial Vine/Liana
Flowers White Jun, Jul, Aug
Cultivation: A summer blooming climber, which can be used as a cut flower to carry a sweet scent throughout the home. This is a great plant for indoor growing as it tolerates dry atmospheres and periods of neglectful watering. Often trained on a ring or a hoop, the flowers will emerge on the new growth of spring. Remember, only prune in late summer or early fall, once flowering has ceased.
Full or partial sun, grows to 2-3' in container, vining in habit, minimum temperature 50°, blooms in spring and summer.

Fragrant!
Record Notes: Species name checked on IPNI ; cultivar name found used in the trade with internet search, 8/30/2007.

Stevia microchaeta

Asteraceae !

INFO

Common Name:
Perennial Shrub
Height: 15ft.
Flowers White to pink Sept, Oct, Nov
Native Range: Mexico
Description: To15' high at SFBG; leaves up to 17" long, 6" wide. In the fall its huge flora clusters may exceed 20" across, also bearing a mix of white and pink flower heads. In the wild it hybridizes with S. polycephala.
Cultivation: Does well in partial shade to full sun with regular watering. Developing plants benefit from support or judicious pruning to improve structure. Leaf damage occurs when temps drop to the low 20s F. May be susceptible to to oak root fungus, Armillaria.
Record Notes: Name checked with TROPICOS, 2/25/2008.

Taxon | Family Spelling Checked

Stevia rebaudiana — Asteraceae !

INFO
Common Name: sweetleaf
Perennial Herbaceous
Height: 1-2ft.
Flowers White
Native Range: Paraguay & Brazil
Description: From MO Bot Gard:
Stevia rebaudiana, commonly known as sweetleaf, is a tender perennial herb that is native to Paraguay and Brazil. Plants typically grow with weak and floppy stems to 12-24" tall. Plants have little ornamental attraction. The attraction here is the sweet tasting leaves which contain glucoside compounds that are 200-300 times sweeter by weight than cane sugar but with no calories. To date, the FDA has only approved limited use for this plant in the U.S. (Rebaudioside A approved as dietary supplement but stevia leaves are not approved as food additive), but its potential as a sugar-substitute is huge. Slender oblong leaves (to 1") have a pronounced midrib. Tubular flowers are white with no fragrance. Harvest fresh leaves for use in teas. Eat leaves directly off the plant. Leaves may be dried and then saved in jars for future use. Dried leaves are generally sweeter than fresh leaves. Dried leaves may be ground up in a blender into stevia powder.
Cultivation: Winter hardy to USDA Zone 10-11 where plants are best grown in rich, consistently moist, well-drained soils in full sun. Tolerates part shade. Consider raised beds as a way to create sharp drainage. Thrives in sandy loams. Avoid overwatering which may encourage the onset of root rot. Root mulch helps retain soil moisture in hot summer climates. Purchase starter plants if available. Seed (if obtainable) can be started indoors in early spring for planting outside after last spring frost date. Plants may be grown in pots set out on patios during the growing season. Snip off flower buds as they appear (best quality leaves occur prior to flowering). Harvest leaves in fall. If overwintering, bring pots indoors before first fall frost. Cutting may be taken.
Propagation: Seed (if obtainable) can be started indoors in early spring for planting outside after last spring frost date. Plants may be grown in pots set out on patios during the growing season. Snip off flower buds as they appear (best quality leaves occur prior to flowering). Harvest leaves in fall. If overwintering, bring pots indoors before first fall frost. Cutting may be taken.

12/11/2006 Mona Bourell — Mike & Tony found this esablished in bed 14A, but say it's the same as the one in 29G.

8/31/2006 Mona Bourell — Tony & Mike C. found 1 in 29G during inventory on 8/17/2006.

7/12/2006 Tony Morosco — Don Mahoney re-ID'ed the specimen in bed 29G. Plant was unlabled and untagged. ORdered tags and ID sign.

Stewartia monadelpha Theaceae !

INFO
Common Name:
Perennial Tree
Flowers White
Native Range: Japan
Description: Shrub with slender, reddish brown branches, the branchlets glabrous or sparsely ascending-pilose; leaves chartaceous, ovate-elliptic or elliptic to oblong, 4 -8 cm. long, 2-3 cm. wide, acuminate, acute at base, short mucronate-toothed, pilose on both sides or only on midrib on upper side, with axillary tufts of hair beneath, the petioles slender, 2-12 mm. long, often reddish; flowers axillary, white, 1.5-2 cm. across, the pedicels 5-10 mm. long, the bracteoles longer than the sepals; sepals broadly lanceolate to ovate, 4-7 mm. long, entire, ciliate; petals obovate, 12-15 mm. long, obtusely toothed, white-silky on back; ovary white-pilose; capsules 5-angled, ovoid-pyramidal, narrowed above to a beak about 1 cm. across, white-pilose; seedsplanoconvex, dark bown, smooth, obovate, about 5 mm. long, narrowly wnged.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Stewartia pseudocamellia — Theaceae !

INFO
Common Name:
Perennial Tree
Height: 30-40ft.
Flowers White Jun, Jul, Aug
Native Range: Japan
Description: Stewartia pseudocamellia is a slow-growing deciduous tree, attaining a height of 30 to 40 feet and a width of 25 to 30 feet. The camellia-like flowers emerge in summer much later than many other flowering trees. The white flowers are 2 to 3 inches across, with a tuft of yellow anthers. The leaves are thick like those of a Camellia, smooth, bright green with often a reddish tinge, turning gold and crimson in the autumn. The bark peels exposing contrasting colors.
Record Notes: Spelling checked in GRIN database 12-17-2005; further research needed on authors, native regions, common names, etc.

Stewartia pteropetiolata — Theaceae !

INFO
Common Name:
Perennial Tree
Height: 15-45ft.
Flowers White
Native Range: China: S and W Yunnan
Synonymy: Hartia sinensis; Hartia serratisepala
Description: Trees 6-15 m tall, evergreen. Year-old branchlets purple, glabrous; current year branchlets grayish yellow pubescent. Petiole 1-1.5 cm, gray pubescent, wings ca. 3 mm wide; leaf blade elliptic to oblong, 6-10(-13) × 2.5-4.5(-5) cm, leathery, abaxially yellowish green, sparsely pubescent or glabrescent, and trichomes evident along midvein, adaxially green, shiny, and glabrous, midvein red, secondary veins 10-12 on each side of midvein, secondary and reticulate veins abaxially raised and adaxially impressed, base rounded, margin serrate, apex abruptly acute to shortly acuminate. Flowers solitary, ca. 3 cm in diam. Pedicel 8-10 mm, appressed pubescent; bracteoles persistent, elliptic, 5-7.5 × 3-3.5 mm, appressed pubescent. Sepals purplish red, long ovate, 1-1.5 × 0.7-1 cm, leaflike, both surfaces white sericeous, veins pinnate, margin serrulate, apex acute. Petals white, broadly obovate to suborbicular, 1.5-1.8 × 1-1.3 cm, outside basally white sericeous, apex rounded. Stamens 7-9 mm; filaments basally connate. Ovary ovoid, 3-4 mm, glabrous; style ca. 5 mm. Capsule long ovoid, 1.5-2 × 1-1.5 cm, 5-loculed with 4 seeds per locule; columella ca. 5 mm, apically abortive. Seeds obovate, ± compressed, ca. 5 × 3.5 mm, narrowly winged. Fl. Apr-May, fr. Sep-Nov. 2n = 36*.

● Forests; 1200-2600 m. S and W Yunnan.

Stewartia rostrata — Theaceae !

INFO
Common Name:
Perennial Shrub/tree
Flowers White
Native Range: China
Synonomy: Stewartia glabra S.Z. Yan; Stewartia sinensis var. rostrata (Spongberg) Hung T. Chang
Description: Shrubs or trees, to 10 m tall, deciduous. Bark slate gray. Branches ascending, usually several from base; outer bark on current year branchlets not exfoliating; winter buds compressed, ca. 5 mm, with 2 or 3 finely pubescent imbricate scales. Petiole (2-)4-6 (-9) mm, adaxially shallowly grooved; leaf blade ovate to elliptic, (2-)6-10.5 × (1.2-)2.5-4.5 cm, papery, abaxially sparsely appressed villous especially along midvein and tufts of short trichomes in axils of midvein and secondary veins, adaxially glabrous, midvein abaxially elevated, base rounded, margin serrate, apex acuminate. Flowers axillary. Pedicel 5-7 mm; bracteoles persistent, subopposite, subtending calyx, ovate, (1.2-) 1.5-2 × (0.6-)0.8-1.2 cm, leaflike, margin irregularly undulating, apex acuminate. Sepals 5, persistent, similar to bracteoles, ovate, obovate, or orbicular, 1.2 -1.8 × 0.7-1 cm, basally connate, margin irregularly undulating, apex acute to rounded. Petals 5, white, obovate to suborbicular, 2.8-3.8 × 2-3 cm, outside finely sericeous, basally connate, margin erose. Stamens numerous; filaments to 2.5 cm, basally connate into a 6 -8 mm tube and adnate to petals, distinct parts pubescent. Ovary subglobose, 5-angled, basally densely sericeous, apically glabrous; style 1.6-1.8 cm, glabrous, terminating in 5 marginally ciliate stigmatic arms. Capsule subglobose, 1.2-1.6 × 1.4-1.6 cm, 5-loculed with 4 seeds per locule, apex rostrate. Seeds obovate in outline, planoconvex, 8-10 × 6-7 mm, narrowly winged. Fl. May-Jul, fr. Sep.
Native habitat: Forests, along streams; 600-1500 m. Anhui, Henan, Hubei, E Hunan, Jiangxi, Zhejiang.

Stipa elegantissima — Poaceae !

INFO
Common Name: Elegant Feather-grass
Perennial Graminoid
Native Range: Australia
Description: HABIT Perennial. Rhizomes short. Culms rambling, or scandent; 200–300 cm long. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths scaberulous; glabrous on surface. Ligule an eciliate membrane; 3–5 mm long; lacerate. Leaf-blades involute; 1–2 mm wide.
INFLORESCENCE Inflorescence a panicle; deciduous as a whole.
Panicle open; 15–25 cm long. Primary panicle branches whorled at most nodes; branching divaricately. Panicle branches plumose.
Spikelets solitary. Fertile spikelets pedicelled. Pedicels filiform; plumose.
FERTILE SPIKELETS Spikelets comprising 1 fertile florets; without rhachilla extension. Spikelets lanceolate; subterete; 8–10 mm long; breaking up at maturity; disarticulating below each fertile floret. Floret callus evident; 1 mm long; pubescent; acute.
GLUMES Glumes persistent; similar; exceeding apex of florets; thinner than fertile lemma. Lower glume lanceolate; 8–10 mm long; 0.75–0.85 length of upper glume; membranous; without keels; 3 -veined. Lower glume surface pubescent. Lower glume apex acuminate. Upper glume lanceolate; 8–10 mm long; membranous; without keels; 3 -veined. Upper glume surface pubescent. Upper glume apex acuminate.
FLORETS Fertile lemma lanceolate; subterete; 8 mm long; coriaceous; without keel. Lemma surface scabrous; rough above; pubescent; hairy at base. Lemma margins convolute; covering most of palea. Lemma apex awned; 1 -awned. Principal lemma awn geniculate; 30–55 mm long overall; with twisted column. Column of lemma awn 15 mm long; plumose. Palea 2 mm long; 0.25 length of lemma; 2 -veined; without keels.
FLOWER Stigmas 2.
DISTRIBUTION Australasia: Australia.

Stipa gigantea Poaceae !

INFO
Common Name: Golden Oats, Giant feather grass
Perennial Graminoid
Height: 4-6ft. Spread: 3-4ft.
Flowers Brown Summer - Fall
Native Range: Europe: Iberian peninsula
Description: This is a very striking evergreen grass that forms a spiky clump of arching deep green foliage from which a huge sheaf of very long-stemmed, oat-like flower-heads erupts in mid-summer, up to 1.8m (6ft) high. When mature, these splay apart to make a wide fountain shape that almost hides the plant. The seed-heads dry out naturally on the plant and persist into early winter, where they make a good architectural feature, especially when outlined in frost. This is an excellent alternative to pampas grass as a lawn specimen in small gardens, and perfect in a border or a gravel garden. It is found growing wild in Spain and Portugal.
Propagation: divide plants from mid-spring to early summer.
Record Notes: Name checked with The Plant List on 5/19/2014 by Mona Bourell.

Stokesia laevis 'Klaus Jelitto' Asteraceae !

INFO
Common Name:
Perennial Herbaceous
Height: 1.5-2ft.
Flowers Blue Jun, Jul, Aug
Description: This bold perennial sports leathery, strap-like leaves to form a clump from the base, and supports large daisy-like flowers on the end of each stem. Flowers are a light and lovely powder blue. This plant is named after Klaus Jelitto, the German seedsman, should be honored. Great for summer color in beds, borders or containers. Klaus Jelitto is prized as a highly decorative border plant and also produces excellent cut flowers. Herbaceous perennial. Full sun. Moderate growth to 18 to 24 inches tall and as wide.
Record Notes: Species name checked with IPNI; cultivar name sound used in the trade with internet search, 2/13/2008.

Strelitzia alba Strelitziaceae !

INFO
Common Name: White Bird of Paradise
Perennial Herbaceous
Height: 12-18ft. Spread: 6-12ft.
Flowers White, Blue winter - spring
Native Range: South Africa
Description: The white Bird of Paradise Strelitzia alba is a larger tree form than the Orange Bird of Paradise. It often will be in clumps five to six feet wide and stand eighteen feet tall. The leaves are shaped the same as the Orange Bird of Paradise but are much larger. the leaves are 18 to 24 inches wide and three to four feet long. The petiole is often four to five feet tall. The flower is shaped like the Orange Bird of Paradise but is significantly larger, 10 to 12 inches long. The flower is also white with a light blue "tongue" and sits in a purplish bract (the boat like structure at the bottom of the flower). Parts of plant are poisonous if ingested
Cultivation: Sun to Partial Shade. Keep evenly watered. USDA Zone 10a-11
Propagation: By divisions or from seed: Bag seedheads to capture ripening seed. Allow seedheads to dry on plants; remove and collect seeds. Germinate in a damp paper towel, Scarify seed before sowing
Record Notes: name checked in IPNI, 11/18/2004, Geoff Smick.

Taxon Family Spelling Checked

Strelitzia nicolai
Strelitziaceae !

INFO
Common Name: White Bird of Paradise, Natal wild banana, Black Bird-of-Paradise Tree
Perennial Tree
Height: 30ft. Spread: 6ft.
Native Range: South Africa
Description: A large growning evergreen tree reaching up to 10m when mature. Banana like leaves are produced up to 3m in length. Large bluish flower buds are produced in early spring, these slowly open to release the white flowers enclosed within. The flowers stamen are blue in colour with white pollen, after several days this pollen slowly turns yellow. Triangular seed capsules are produced after successful pollination. This plant has become very popular in sub-tropical area for landscaping. A easily grown plant requiring very little maintenance.
Cultivation: Originating from a sub-tropical climate, plants are best grown at temperatures between about 10°C and 24°C. Temperature as low as 5°C can be toleratred for short periods of time, leaf damage may occur at low temperatures. Must have a direct sunlight or an equivalent artificial light source to produced flowers. A basic potting media which retains moisture and is free draining can be used for this plant. Try to allow plant to dry out moderately between waterings. Provide a medium level of humidity for this species.
Potential Problems:- Mealybugs, Scale and Spider Mite (Indoors) are a pests known to attack this plant. Scale and Mealybugs usually occur when a plant is placed into an area with poor light or a poor air flow.
Propagation: Seeds, plants that are grown from seed take many years to produce flowers. Division, clumps can be divide in early spring, ensure any cuts are sealed where possible to prevent fungus.

Plant had wrong sign in front of it indicating Strelitzia reginae var juncea. Accession record created 6/7/2010.

Taxon Family Spelling Checked

Strelitzia reginae 'Mandela's Gold' Strelitziaceae !

INFO
Common Name: yellow strelitzia, yellow crane flower, yellow bird of paradise, geelkraanvoel blom, geel piesang
Perennial
Description: Yellow-flowering strelitzias have been known for a number of years, plants have cropped up in France, California, Australia, Japan and in South Africa at a few locations in Eastern Cape and at Kirstenbosch and the Karoo Desert National Botanical Gardens, but always as isolated specimens. Left to their own devices, the seeds from these yellow forms will not breed true as they will most likely have been pollinated by an orange plant. To get yellow progeny, two yellow plants must be crossed. At Kirstenbosch in the 1970's, there were seven yellow plants in the nursery. John Winter, who was curator during this period, began a project to increase the stock. It took nearly twenty years of careful selection and hand-pollination, and in 1994 the original stock had been built up enough to enable us to introduce the yellow strelitzia to horticulture. It was released and traded under the name 'Kirstenbosch Gold' until 1996 when the NBI was granted permission to re-name it in honour of Nelson Mandela.

'Mandela's Gold' is a stemless, evergreen clump-forming perennial. Greyish green, banana-like leaves grow to a height of about 1.5 m and during winter and spring the large bird-like flowers are held above the foliage on the tips of long, sturdy stalks. The structure and pollination of the flowers is fascinating. The hard, beak-like sheath from which the flower emerges, is called the spathe. This is held at right angles to the stem, and has the appearance of a bird's head. Each spathe contains 4 to 6 flowers, and these emerge one at a time from the spathe. Each flower consists of 3 clear yellow sepals and 3 deep purple petals. The yellow sepals give the appearance of a crest on the 'bird's' head. Two of the purple petals are joined together around the stamens and the style to form an arrow-like structure. The third purple petal is visible as a small scale.Nectar is produced by a gland at the base of the flower. In fact, so much nectar is produced that it leaks out and drips down the side of the spathe. Although it is not certain exactly which bird is the pollinator, when it comes to feed on the nectar, it perches on the arrow-like purple petals, which open to expose the anthers and the sticky

Taxon Family Spelling Checked

Streptocarpus kentaniensis

Gesneriaceae !

INFO

Common Name: Cape Primrose, Kentani streptocarpus, Kentani Cape Primrose
Perennial Herbaceous
Height: 0.5ft. Spread: 1ft.
Flowers White Winter
Native Range: Southern Africa
Description: Compact plant with unusually narrow and succulent leaves. The flowers are small, but ae produced in great numbers on a mature plant. Unlike many other species, S. kentaniensis seems to bloom more readily under winter short-day conditions, and consequently is being used to introduce that trait into showier hybrids. Streptocarpus can be difficult to identify, but this species is unique in many ways. Most striking is the abundance of small white flowers in mid-winter when no other Streptocarpus species are in flower. Even when not in flower the plant is easy to recognize with its long, narrow and stiff, almost succulent leaves.
Cultivation: Streptocarpus kentaniensis makes a lovely small pot plant, suitable for a shady place in the garden and for indoors. A warm spot with plenty of light but no direct sun is ideal for growing the plants. It is very important that all Streptocarpus are potted in a well-drained medium and not over-watered. Rather let the potting mix dry before giving the next watering, as the plants will wilt and rot with over-watering. When the plants are stressed by drought or cold during the winter, the tips of the leaves will sometimes turn brown and dry. The dead tips may look a bit untidy but do not harm the plant, they leaves will continue to grow from the base.
Propagation: Streptocarpus kentaniensis is easy to multiply simply by dividing a group, carefully separating a few leaves or an individual leaf with its roots attached and repotting it. Streptocarpus can also be propagated from seed or leaf cuttings. Thousands of fine brown seeds are released a month or two after flowering. The seeds usually germinate quite easily and fast when sown on a fine potting mix that is kept moist and warm. The seedlings can be potted when they are large enough to handle. The leaf cuttings are made by cutting the leaf across the midrib, dipping the cut edge into rooting hormone and then placing it into a well-drained medium, like clean sand. New roots will form at the cut edge, followed by new leaves. The potting medium for growing strong and healthy Streptocarpus is very

Strobilanthes atropurpureus — Acanthaceae !

INFO
Common Name: Kashmir acanthus
Perennial Shrub
Height: 3-5ft.
Flowers Violet
Native Range: Pakistan, India, Nepal, Bhutan
Synonymy: Ruellia atropurpurea
Description: An erect, up to 90 cm, perennial shrublet with succulent, 4-angled or deeply 4-furrowed, white pubescent twigs. Leaves almost glabrous, subsessile or with up to 8 cm long, winged petiole; lamina of lower leaves on sterile shoots elliptic-oblong, 25-30 x 6-8 cm, long acuminate, lamina of flowering shoot leaves ovate or ovate-lanceolate, 3-7.5 x 2.5-3 cm, crenate to sharply serrate. Flowers blue to dark blackish-blue, 2.5-3 cm across, solitary or paired, in interrupted leafy, up to 15 cm long spikes; bracts foliaceous, up to 2.5 cm persistent; bracteoles linear-oblong, hairy. Calyx 5-lobed to the base, c. 1.2 long, lobes linear-oblong, c. 8 -10 mm long, ± obtuse, patently glandular-hairy, slightly enlarged in fruit. Corolla 2.5-4.5 cm long, glabrous externally, tube pale to nearly white, cylindrical below, curved above, hairy within, limb lobes subequal, obtuse. Filaments hairy, anthers muticous at base. Style tips recurved. Capsule oblong, 1.6-1.8 cm long, 4-seeded, glabrous. Seeds c. 3 mm hairy. In Himalayas: Fl. Per.: June-October.

Type: Central Nepal, Wallich 2398 (K-W).

Distribution: Pakistan, N. India, Nepal and Bhutan. forest undergrowth. It flowers in abundance at intervals of nearly 12 years (Parker l.c.).

Cultivation: Strobilanthes are happiest in part-shade in well-drained soil that retains moisture. They do not thrive in poor soil in full sun. The prostrate S. attenuata will produce roots along the stems and self-layer, thereby colonising deep shade.
Slugs do not like the pungent foliage and pests seem few and far between. Cut back in late autumn as this plant normally collapses as soon as cold weather strikes

Taxon Family Spelling Checked

Strobilanthes dyeranus — Acanthaceae !

INFO
Common Name: Persian shield
Annual Herbaceous
Height: 5ft.
Native Range: Burma
Description: Persian Shield is a beautiful foliage plant with a unique coloring that you absolutely can not get with any other plant. It grows to about 5' with bright purple leaves and green veins, and as if that isn't beautiful enough, it looks like it has been dry- brushed with silver, creating an iridescent glow. Strobilanthes dyeranus should be grown in shade gardens or in filtered light, as bright sun will dull the color. Strobilanthes loves to be watered, and appreciates a good amended soil, but needs good drainage or it will rot. It is an excellent plant for containers and is a good foil for some of the new black plants. It is deer and rabbit resistant and takes the heat and humidity well. Also great for shade gardens as well as for an accent plant
Cultivation: Strobilanthes are happiest in part-shade in well-drained soil that retains moisture. They do not thrive in poor soil in full sun. The prostrate S. attenuata will produce roots along the stems and self-layer, thereby colonising deep shade.
Slugs do not like the pungent foliage and pests seem few and far between. Cut back in late autumn as this plant normally collapses as soon as cold weather strikes. Once established there is no need for protection or mulching.

Propagation: Take cuttings of strobilanthes in early summer. Choose new growth that is just starting to harden off. Cut under the node and plunge into horticultural sand. They should root quickly. Pot up immediately.

The taller S. wallichii self-seeds and these woody seedlings soon develop a robust root. Remove them early and pot up or compost if they are not needed. Seeds can also be collected for sowing later.

Strophanthus speciosus — Apocynaceae !

INFO
Common Name:
Perennial Vine/Liana/shrub
Flowers Pale yellow, reddish brown
Native Range: South Africa
Description: A scrambling shrub or strong woody vine. Leaves in whorls of three, narrowly elliptic or oblanceolate, glossy green above, dull and paler below. Flowers in clusters at the ends of branches, the long, twisted corolla lobes pale yellow, reddish brown towards the base. The fruit is a two-horned pod.

Derivation of specific name: speciosus: showy, good-looking
Habitat: Evergreen forest and forested ravines.
Altitude range: (metres) 900 - 1800 m
Flowering time: Sep - Oct
Worldwide distribution: Zimbabwe, S Africa and Swaziland.
Record Notes: Name checked with The Plant List on 6/3/2013 by Mona Bourell.

Perennial Tree
Native Range: Japan, Korea
Synonomy: Sophora japonica; Sophora korolkowi; Sophora pubescens; Sophora sinensis; Sophora griffithii subsp. korolkowii

Description: Trees, to 25 m. Bark gray-brown, longitudinally striate; branches of current year green, glabrous. Leaves 15-25 cm; stipules ovate to linear, caducous; petiole inflated at base, bud hidden; leaflets 9-15; stipels subulate; blades ovate-lanceolate or ovate-oblong, 2.5-6 × 1.5-3 cm, papery, glaucous and sparsely to densely pubescent abaxially, usually becoming gla-brate, base broadly cuneate or rounded, apex acuminate, mucro-nate. Panicles terminal, to 30 cm; bracteole subulate. Calyx shortly campanulate, 3.5 -4.5 mm; teeth 5, obtuse, pubescent. Corolla white or creamy yellow, rarely purple-red; standard broadly ovate, claw short, base cordate, apex retuse; wings ovate-oblong, ca. 10 × 4 mm; keel similar to wings, but broader. Stamens 10, unequal, free, persistent. Ovary glabrescent. Leg-umes green, moniliform, 2.5-5 × ca. 1 cm, obviously con-stricted between seeds, indehiscent, fleshy. Seeds 1-6, yellow-green, black-brown when dry, ovoid. Fl. Jul-Aug, fr. Aug-Oct.
Cultivated throughout China [native to Japan and Korea; widely cultivated elsewhere].
Many intergrading varieties and horticultural forms exist that are not worthy of recognition at this level. Sophora angustifoliola appears to be merely a narrow-leaved form of this species.
Record Notes: Name checked with The Plant List on 7/21/2014 by Mona Bourell. Original accession as Sophora japonica which is a synonym.

Styrax japonicum — Styracaceae X

INFO

Common Name: Japanese Snowball
Native Range: Japan
Description: A very attractive large shrub or small tree (reaching 8-10 m / 26-32 feet high in Japan) with wide spreading branches. Prefers a moist, rather acidic soil, sun or part-shade and protection from strong wind. Best planted where the flowers can be admired from beneath.

Deciduous trees 4–8(–10) m tall. Branchlets brown, sparsely stellate hairy when young, soon glabrous. Leaves alternate, chartaceous; petiole 3–10 mm long, stellate hairy when young, later glabrous; blade ovate or oblong-ovate, 3–9 cm long, 2–4 cm wide, base acuminate or cuneate, attenuate into petiole, shallowly acute-serrate, upper surface glabrous or sparsely stellate hairy on nerves, lower surface sparsely stellate hairy, especially on nerves, midrib slightly depressed on upper surface, prominently raised on lower surface, lateral nerves 4–5-paired, arching slightly raised on lower surface. Flowers May to June, pendulous. Inflorescences terminal, short racemose, 1–5-flowered, with 1–3 small leaves at base; peduncle slender, 2–4 cm long, stellate hairy near base; pedicel slender, 2--2.5 cm long, glabrous. Calyx campanulate, 4–5 mm long and across, glabrous, shallowly 5-lobed; lobes widely triangular-ovate, acute, 1–1.5 mm long, 2 mm wide, pilose on margin. Corolla rotate-funnelform, white, 2–2.5 cm across, deeply 5-lobed; tube 2–3 mm long, glabrous outside; lobes oblong-ovate, acute, 10–15 mm long, 4–6 mm wide, densely stellate hairy on both surfaces. Stamens 10, adnate to corolla tube, 8–10 mm long; filaments filiform, stellate hairy near base; anthers linear, acute, sparsely stellate hairy. Ovary ovoid, densely white-ciliate. Style filiform, straight, 10–13 mm long, white-ciliate near base; stigma punctate. Fruit a dry drupe, whitish gray, globose or ellipsoid, 8–12 mm long, 8 mm wide, densely sericeous, longitudinally dehiscing by 2 valves, generally one seeded. Seeds ellipsoid, brown, 6–10 mm long, 4–8 mm across, smooth.

Styrax obassia — Styracaceae !

INFO
Common Name:
Perennial Tree
Native Range: Japan
Description: Deciduous trees 6–15 m tall. Branchlets green, stellate hairy when young, soon glabrous, previous year's branches blackish red, bark longitudinally fissured and peeling off. Leaves alternate, chartaceous; petiole 0.5–2 cm long, densely stellate hairy when young, later glabrous, dilated and covering a bud at base; blade orbiculate-ovate or orbiculate-elliptic, 8–17 cm long, 5–15 cm wide, apex abruptly caudate-acuminate, base rounded, remotely and shallowly apiculate-dentate on margin, upper surface sparsely stellate hairy on nerves, lower surface glaucous, densely stellate tomentose, with a raised midrib and 5--7 pairs of parallel lateral nerves. Flowers late May to early July. Inflorescences terminal, racemose, 10–18 cm long, 5–6 cm across, many-flowered, ebracteate, except lower flowers. Peduncle glabrous. Pedicel 5–10 mm long, densely clothed with white stellate tomentose hairs, mixed with scattered brownish large stellate hairs. Calyx campanulate, ca. 5 mm long, 4 mm wide, densely clothed with white tomentose hairs, intermixed with scattered brownish stellate hairs, acutely 5-dentate at apex. Corolla rotate-funnelform, white, ca. 2 cm across, white stellate-tomentose on both surfaces, deeply 5-lobed; tube ca. 5 mm long; lobes oblong-ovate, acute, 13–15 mm long, 5–6 mm wide. Stamens 10, 10–12 mm long; filaments filiform, adnate to corolla tube, glabrous; anthers linear, ca. 4 mm long, obtuse at apex. Ovary ovoid, stellate-tomentose. Style filiform, straight, 20–24 mm long, glabrous except white tomentose at base, stigma punctate. Fruit a dry drupe, ovoid, acute at apex, 15–18 mm long, 8 mm wide, densely white-tomentose, dehiscing by 2 valves, one-seeded. Seeds ellipsoid, brown, 10–12 mm long, 6 mm across, smooth.

Styrax officinalis var. redivivus — Styracaceae ?

INFO
Common Name: California snowdrop bush, Snowdrop bush, Storax
Perennial Shrub
Native Range: California
Synonomy: Styrax officinalis L. var. californicus (Torr.) Rehd.; Styrax officinalis L. var. fulvescens (Eastw.) Munz & I.M. Johnst. Hair density and color variable throughout range
Description: Shrubs, to 4 m, not suckering from roots. Leaves: petiole 3-14 mm; blade with (6-)7-8(-9) secondary veins, broadly elliptic, ovate, obovate, or orbiculate, 3-7.5 (-11.7) × 2.5-6.5(-8.8) cm, margins entire, longest arms of abaxial hairs 0.1-0.4 mm. False-terminal inflorescences 2-6-flowered or solitary flower, 2 -5 cm; axillary flowers absent. Pedicels 4-9 mm, 0.5-1.4 times as long as calyx. Flowers: calyx 4-7 × 5-7 mm; corolla 16-26 mm, tube 5-6 mm, lobes 5-7(-8), imbricate in bud, slightly reflexed, elliptic, 10-21 × 4-7 mm; filaments connate 2-7 mm beyond adnation to corolla. Capsules globose, 11-15 × 10-12 mm (broader when 2 -3-seeded), tawny or fulvous stellate-pubescent, at least when mature, dehiscent nearly or completely to proximal end, broadly exposing seed(s); fruit wall 0.3 -0.5 mm thick. 2n = 16.

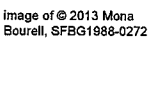

image of © 2013 Mona Bourell, SFBG1988-0272

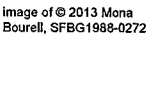

image of © 2013 Mona Bourell, SFBG1988-0272

Flowering Apr-May; fruiting Aug-Oct. Chaparral, foothill woodland, yellow pine forest; of conservation concern; 0-1500 m; Calif.

Styrax redivivus has often been treated as an infraspecific taxon in S. officinalis Linnaeus of the eastern Mediterranean region. Morphological and molecular data (P. W. Fritsch 1996, 1999, 2001) provide evidence that strongly supports its species status. These data also establish the Texas species S. platanifolius as the closest relative of S. redivivus, and the two species together form a clade that is sister to S. officinalis.

Characters used to justify recognition of var. fulvescens of southern California have been shown to be clinal from north to south across the range of Styrax redivivus (P. W. Fritsch 1996b) and are here considered taxonomically inconsequential.

Another binomial sometimes used for Styrax redivivus is S. californicus, but this name does not have priority

Syagrus litoralis Arecaceae !

INFO
Common Name: silver queen
Perennial Palm
Height: 40ft. Spread: 14ft.
Native Range: Brazil
Description: From the Palm Society - Northern California Chapter - The Silver Queen is now beginning to appear in northern California landscapes. A newly described palm native to Brazil and is closely related to Syagrus romanzoffiana. This is a palm that has been growing in southern California, Arizona and Florida for a few years now and is looking like a contender for the cooler northern California climate. It is referred to as the Silver Queen although like any other new introduction, there are a few other common references that are associated with this palm such as "Coastal Queen Palm", "Black Queen" and "Brazilian Robust". The most frequently heard common name is Silver Queen. The botanical name is not yet defined while some are calling this tree "Syagrus romanzoffiana var. litoralis" and some refer to it as "Syagrus litoralis". The name Silver Queen comes from the heavy tomentum and bicolor leaf characteristic. The undersides of the leaf on mature specimens have a whitish cast to them producing a silver appearance when the sun shines on them. This is a more robust "queen palm" with a thicker trunk and dense compact canopy. With cold tolerance reports of down to 15 degrees F, and is likely due to the thicker trunk, although some reports are that there has been little sign of freeze burn damage at this temperature. This seems to be a better choice for cold spot microclimates than the standard Syagrus romanzoffiana. While other varieties of queen palm are known to grow to 60 feet tall, the Silver Queen is only known to grow to 40 feet tall. The other most outstanding characteristic that identifies this species is the rich "gradiant" purple to green (and almost black in older specimens) color in the petioles of adult trees which radiates from where the petiole is attached to the trunk. There will likely be some variables in specimens as there are with many other species and natural hybridization will also most likely occur where Syagrus is available. Silver Queen is unusual with its purple petioles. Also noted is a heavier than usual tomentum that forms around the fibrous newly formed leaf bases. This particular palm likes a slightly acid soil when planting. These require monthly feeding during the warm growing season. The Silver

Sycopsis sinensis Hamamelidaceae !

INFO
Common Name:
Perennial Tree
Native Range: China, Taiwan
RARE or ENDANGERED in native range
Description: Trees to 14 m tall; young branches lepidote, older growth drying dark brown, glabrous. Petiole 0.8–1.8 cm; leaf blade narrowly ovate or lanceolate, 5–12 × 2.5–4 cm, discolorous, abaxially sparsely stellately pubescent, glabrescent, adaxially shiny, stellately pubescent when young, soon glabrous, base cuneate or obtuse, margin entire or distally serrulate, apex acuminate; lateral veins 6 or 7 on each side. Inflorescences 7- or 8-flowered. Floral bracts brown, ovate-rounded, 6–8 mm, stellately pubescent. Male flowers: floral cup short, reduced pistil pubescent. Bisexual flowers: floral cup 1.7–2 mm, pubescent. Sepals ovate. Filaments slender, 1–1.2 cm; anthers red, 1.8–2 mm, apex acute. Ovary pubescent; styles 5 mm, coiled backwards. Capsules 8–10 mm, villous, dehiscing irregularly; persistent floral cup 3–4 mm; persistent styles 1–2 mm. Seeds 5–7 mm. Fl. Apr–Jun, fr. Jul–Sep.
Native habitat: Mountain thickets, evergreen forests; 1300–1500 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Shaanxi, Sichuan, Taiwan, Yunnan, Zhejiang.Fujian, Guangdong,

Symphionema montanum Proteaceae !

INFO
Common Name:
Perennial Shrub
Height: 2-3ft. Spread: 3ft.
Flowers White Summer
Native Range: Australia: NSW
Description: Attractive small bushy shrub 2-3'x3' with light green divided leaves (parsley-like) and creamy-white profuse flowers appearing in spring-early summer. Plants prefer well-drained acidic soils in partial shade and are hardy to frost (20-22F). These showy shrubs are excellent border shrubs and/or container plants. Pruning promotes compact growth habit. Grows naturally in the Blue Mountains west of Sydney where it often snows in winter. [australian Native plant nursery website]
A small shrub up to about 0.5 metre high with attractive lobed foliage. Leaves are about 50mm long and divided into several segments. The cream-coloured flower clusters occur at the ends of the branches in attractive spikes about 75mm long. S.montanum is rarely seen in gardens although it would seem to be an ideal garden plant for cool, mountain areas. Limited experience at low altitudes indicate that it may be difficult to maintain for more than a few years. It should be planted in well drained, light soils which do not dry out. Full sun or a lightly shaded position is prefered. [http://farrer.riv.csu.edu.au/ASGAP/s-mont.html]
Cultivation: May be difficult to maintain for more than a few years. It should be planted in well drained, light soils which do not dry out. Full sun or a lightly shaded position is prefered.
Propagation: Propagation can be carried out fairly easily from cuttings using firm, current season's growth. There is no reported experience with propagation from seed.

Notes
8/12/2005 Mona Bourell — Only plant reported dead in 0B4 by Jeanne Rich. Deaccessioned.

12/21/2004 Geoff Smick — I never saw this plant or a marker for where to plant it during the Australian planting. It could have been planted out in 60 or 64, or it may have never made it up to the area. The landscape designer in charge of placement did not recall this specimen.
Seems Tony Morosco never saw this specimen after shipment received, lost

Symphoricarpos albus ssp. laevigatus Caprifoliaceae !

INFO
Common Name: common snowberry
Perennial Shrub
Native Range: Western North America
Synonomy: Symphoricarpos albus ssp. laevigatus, Symphoricarpos rivularis
Description: Plant erect, 6–18 dm, glabrous or puberulent
Stem: branches stiff, spreading; new shoots erect, unbranched, often with inflorescence, their leaves larger, more variable
Leaf: blade generally 1–3 cm (those of new shoots –6 cm)
Inflorescence: flowers 8–16
Flower: calyx limb spreading, divided halfway; corolla 4–6 mm, bell-shaped, pink, swollen on lower side, glandular within swelling, lobes ± 1/2 corolla length, lobes and upper throat ± densely hairy inside, lobes ± erect
Fruit 8–12 mm, round
Seed 4–5 mm
Ecology: Shady woods, streambanks, n slopes
Elevation: < 1200 m.
Bioregional distribution: Northwestern California, w edge Cascade Range, n Sierra Nevada Foothills, Central Western California, Southwestern California
Distribution outside California: to Alaska, Montana
Synonyms: S. rivularis Suksd
Naturalized in e US. Fr may be TOXIC to humans

Symphoricarpos mollis Caprifoliaceae !

INFO
Common Name: creeping snowberry
Perennial Shrub
Flowers Pink, Red
Native Range: Ca
Synonomy: Symphoricarpos albus var. mollis
Description: The plant is a tall creeping shrub which bears bunches of red or pink rounded, bell-shaped flowers and spherical or bulbous white or pink-tinted fruits. The fruits are not generally considered toxic but are distasteful, having a soapy texture due to the presence of saponins.

Pink flowers are used by hummingbirds, the snowberries are used by California Thrashers(when they get real hungry as the berries taste like Ivory soap). A delightful, slow-growing groundcover in a shady garden in places like Los Angeles, San Francisco, and San Diego.

between 30 and 9843 feet [Calflora 2004 (m)]
Cultivation: The shrub does well in warm climates and can tolerate both intense sun and constant shade. It is a plant of chaparral ecosystems, especially along coastlines. It reproduces via rhizome and seed

Creeping Snowberry grows on north slopes, in ravines, and sometimes is all that's left of an oak woodland in full sun. The more coastal the setting the more sun this snowberry can handle. The best plants I've seen are along the edge of an interior climate in the heavy shade of Umbellularia californica and Quercus agrifolia a few miles from here. They were growing flat and 5' across with the leaves 1 foot between nodes.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=35335 useage as 'accepted'. 2004-07-19.

Symphyotrichum chilense Asteraceae !

INFO
Common Name: California Aster
Perennial Shrub
Flowers Purple, Yellow
Native Range: California - Br. Col.
Synonomy: Aster chilensis Nees; A. chilensis var. invenustus (Greene) Jepson

Description: Perennials, 40–100(–120) cm, co-lo-nial or cespitose; long-rhizom-atous. Stems 1–5+, ascending or erect, glabrous or hirsute. Leaves thin, margins entire, apices usually acute, faces glabrous or sparsely puberulent; basal withering by flowering, petiolate, blades (linear-)oblanceolate to obovate, 30–200 × 4–40 mm, bases attenuate, margins entire to finely serrate, apices acute; proximalmost cauline sometimes withering by flowering, sessile, blades broadly to narrowly oblanceolate, 40–150 × 5–30 mm, bases usually ± attenuate or cuneate; distal sessile, blades lanceolate to oblanceolate, 25–90 × 5–30 mm, bases cuneate. Heads in open, paniculiform arrays, some branches at least 20+ cm. Peduncles puberulent, bracts 3–10, lanceolate to elliptic, margins often scabrous to ciliolate. Involucres campanulate, 5–8 mm. Phyllaries in 3–5 series, oblanceolate or oblong (outer) to linear (inner), unequal to subequal (outer usually shorter than inner, if so, lengths less than 3 times widths), bases scarious (outer) less than 1 / 2 or sometimes wholly foliaceous, inner scarious, margins eciliate or ciliolate, green zones oblanceolate to obovate or linear (innermost), apices (outer) obtuse, (inner) acute, faces glabrous or puberulent. Ray florets 15–40; corollas violet, laminae 9–15 × 1.5–2.5 mm. Disc florets 35–60+; corollas yellow, 4–8 mm, lobes triangular, 0.5–1 mm. Cypselae brown, cylindric to obovoid, not compressed, 3.5–4.5 mm, 2–4-nerved, faces hairy; pappi white to tawny , 4–8 mm. 2n = 48, 64, 96.
Flowering Jul–Sep. Grasslands, salt marshes, coastal dunes and bluffs, coastal grasslands and scrub, open disturbed habitats in evergreen and Pacific coast coniferous forest; 0–500 m; B.C.; Calif., Oreg., Wash.

Symphyotrichum chilense is restricted to coastal habitats from southwestern British Columbia to central California. It is almost entirely coastal in Oregon, Washington, and southern British Columbia, where it is

Symphyotrichum lateriflorum 'Lady in Black' Asteraceae !

INFO
Common Name: calico aster
Perennial Herbaceous
Height: 3ft. Spread: 3ft.
Flowers White with rose
Synonomy: Aster lateriflorus
Description: 'Lady in Black' is a shrubby aster typically growing to 3' tall with a similar spread. It features unique dark purple foliage which is attractive throughout the growing season. Tiny white asters with rosy centers appear in dense, branching sprays in early autumn on rigid, purplish stems. Species name is a combination of the Latin words for "side" and "flower" in reference to the fact that flowers of this species generally are located on one side of the stems. Plants of this species are sometimes commonly called calico asters.
Record Notes: Name checked with The Plant List on 7/3/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search. Received as Aster lateriflorus 'Lady in Black' which is a synonym

Symplocos paniculata — Symplocaceae !

INFO
Common Name:
Perennial Tree
Native Range: China, Taiwan
Description: Prunus paniculata Thunberg in Murray, Syst. Veg. ed. 14, 463. 1784; Cotoneaster coreanus H. Léveillé; Myrtus chinensis Loureiro; Palura chinensis (Loureiro) Koidzumi; P. chinensis var. pilosa Nakai; P. sinica Miers; Prunus mairei H. Léveillé; Symplocos chinensis (Loureiro) Druce; S. chinensis var. vestita (Hemsley) Handel-Mazzetti; S. crataegoides Buchanan-Hamilton ex D. Don; S. hunanensis Handel-Mazzetti; S. simaoensis Qian Yi-yong; S. sinica Ker; S. sinica var. vestita Hemsley.

Shrubs or small trees, deciduous. Young branchlets glabrous or ± pilose; old branchlets glabrous. Petiole 3--7 mm; leaf blade ovate, elliptic-obovate, or broadly obovate, usually slightly rhomboid, 1.5--11 X 1--5.5 cm, membranous to thinly papery, abaxially glabrous or pubescent, adaxially glabrous or appressed hairy, base broadly cuneate to subcordate, margin sharply glandular dentate, apex acuminate to acute, lateral veins 4--10 pairs. Panicles terminal, consisting of a raceme of cymose corymbs, 2--10 cm; bracts early deciduous, usually linear, ca. 1(--3) mm, brown glandular. Pedicel 0--10 mm, slender, thickening in fruit, articulate at apex. Ovary obconic, 1--1.5 mm, glabrous or hairy, 2-locular, with 4 ovules per locule. Calyx lobes light yellow, ovate to semi-orbicular, 1--1.5 mm, sometimes abaxially hairy, margin ciliate. Corolla 3--6 mm. Stamens 25--60. Disc 5-glandular, glabrous or hairy. Drupes bluish, rarely white, ovate-globose, 3--8 mm. Fl. Apr-Jun, fr. Sep-Nov.

Slopes in mixed forests; 800--2500 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hebei, Heilongjiang, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Shaanxi, Shandong, Shanxi, Sichuan, Taiwan, Yunnan, Xizang, Zhejiang [Bhutan, India, Japan, Korea, Laos, Myanmar, Vietnam].

Symplocos stellaris Symplocaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs or small trees. Buds and young branchlets reddish brown tomentellous but glabrous in var. aenea, soon glabrescent. Petiole 1–3 cm; leaf blade narrowly oblong-elliptic to narrowly obovate, 6–23 X 1.8–5 cm, thickly leathery, glabrous, abaxially smooth, often light colored, and subglaucous, base broadly cuneate to rarely subrounded, margin entire but rarely glands on juvenile leaves persisting and blade margin glandular denticulate, apex mucronate-acuminate to acute, midvein, lateral veins, and reticulate veins abaxially inconspicuous and adaxially impressed, lateral veins 7–15 pairs. Inflorescences a glomerule or condensed spike; bracts and bractlets persistent, 2–3.5 mm, densely tomentose but glabrous except for ciliate margin in var. aenea. Ovary 1–1.5 mm, glabrous. Calyx 1.5–2 mm; lobes semi-orbicular, 0.5–1 mm, glabrous or rarely woolly tomentose, margin ciliate. Corolla 5–8 mm, apically ciliate. Stamens 18–25 or ca. 50 in var. aenea. Disc cylindrical, ca. 0.5 mm, glabrous. Drupes narrowly ovoid-cylindric, ca. 1 cm, apex with persistent erect calyx lobes. Fl. Feb-May, fr. Jun-Sep.

Taxon | Family Spelling Checked

Syncolostemon obermeyerae — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Native Range: South Africa
Synonomy: Hemizygia obermeyerae M. Ashby
Description: Biol./Eco : biology: perennial -Shrub - Ht 1 - 1.5 m. Alt: 800 - 1829 m. Distribution: LP
Syncolostemon obermeyerae is a fast growing, much branched shrub which can grow to 1,8m tall. It is covered with velvety hairs throughout. The broadly ovate to ovate - lanceolate leaves are up to 60mm long and 18 - 30mm in width. The leaves are strongly and pleasantly aromatic and have short petioles. The showy, two-lipped tubular flowers are mauve pink and appear from summer into autumn (December - April), making this a very rewarding plant in the garden.

Recent phylogenetic analyses based on DNA sequence data indicated that the genera Hemizygia and Syncolostemon constitute a monophyletic group. They were subsequently merged under the earliest name, Syncolostemon which necessitated several name changes.

The genus name Syncolostemon is derived from the Greek words, syn, meaning united; kolos, meaning stunted; and stemon, meaning pillar. The species name obermeyerae commemorate Miss Amelia Obermeyer (later to become Mrs. Amelia Mauve) a botanist at the National Herbarium, Pretoria, who first collected this plant in 1931. The plant was described by Ashby in the Journal of Botany (London) in1935.

Syncolostemon obermeyerae is restricted to the Northern Province from the Soutpansberg southwards to just north of the Abel Erasmus Pass in the Northern Drakensberg mountain range.

Syncolostemon obermeyerae grows in grasslands, rocky hillsides and along forest margins. It grows in acidic quartzitic sandstone soil, at an altitude of 1400 - 1800m with a high rainfall of more than 1250mm per annum. Syncolostemon obermeyerae resprouts after fires in grass, lands and is pollinated by bees and other insects.

Cultivation: Syncolostemon obermeyerae is a rapid

Syneilesis aconitifolia Asteraceae !

INFO
Common Name: shredded umbrella plant
Perennial Herbaceous
Height: 1.5ft. Spread: 2ft.
Native Range: China, Korea, Japan
Synonomy: Cacalia aconitifolia Bunge; Senecio aconitifolius (Bunge) Turczaninow.

Description: Herbs, erect, 70-120 cm tall. Rhizomes procumbent, short, with many fibrous roots. Stem purple-brown, simple, glabrous. Stem leaves usually 2 (or 3). Lower leaves long petiolate, peltate; petiole 10 -16 cm, not winged, glabrous, base amplexicaul; blade abaxially gray, adaxially pale green, 20-30 cm in diam., palmately parted, segments 7-9, twice 2- or 3-fid, lobes 2.5-8 mm wide, linear-lanceolate, initially reflexed, closed umbraculiform, densely arachnoid-tomentose, later open umbraculiform, glabrescent, apex acuminate, irregularly acute. Median leaf petioles 2-6 cm; blades smaller, 12-24 cm in diam.; segments 4 or 5. Uppermost leaves sessile or shortly petiolate, bractlike, lanceolate. Capitula many, discoid, arranged in dense compound corymbs, 6-7 mm in diam.; peduncles 5-16 mm, with few linear bractlets. Involucres tubular, 9-12 × 5-7 mm, glabrous at base, margin scarious. Florets 8 -10; corolla pink-white, ca. 1 cm, with narrow, 3.5-4 mm tube and narrowly campanulate limb; lobes 5. Anthers purple, basally shortly hastate. Style branches elongated, compressed, apically obtuse, penicillate-puberulent. Achenes cylindric, 5-6 mm, glabrous, ribbed. Pappus of capillary-like bristles, sordid white to reddish, 8-10 mm. Fl. Jun-Jul, fr. Aug-Oct.

Forest margins on slopes, roadsides; 500-1800 m. Anhui, Fujian, Gansu, Guizhou, Hebei, Heilongjiang, Henan, Jiangsu, Liaoning, Shaanxi, Shanxi, Zhejiang [Japan, Korea, Russia (Far East)].

The roots and whole plant are used medicinally to relax and activate the tendons, alleviate pain around the waist and of the lower extremities, and to treat injuries

Syringa josikaea Oleaceae !

INFO
Common Name: Hungarian lilac
Native Range: Central & E Europe
Description: It is a deciduous shrub growing to a height of 2-4 m. The leaves are elliptic-acute, 6–12 cm long, with a finely hairy margin. The flowers are dark pink, with a tubular base to the corolla 15 mm long with a narrow four-lobed apex 3–4 mm across, with a strong fragrance; they are produced in slender panicles up to 15 cm long in early summer. The fruit is a dry, smooth brown capsule, splitting in two to release the two winged seeds
Syringa josikaea (Hungarian Lilac) is a species of Lilac, native to central and eastern Europe, in the Carpathian Mountains in Hungary, Romania, and western Ukraine

Syringa pubescens ssp. microphylla Oleaceae !

INFO
Common Name:
Perennial Shrub
Flowers purplish red, purple, lilac, pink, to white
Native Range: China
Synonomy: Syringa microphylla Diels, Bot. Jahrb. Syst. 29: 531. 1900; S. giraldiana C. K. Schneider; S. microphylla var. giraldiana (C. K. Schneider) S. Z. Qu & X. L. Chen; S. pubescens var. tibetica Batalin; S. schneideri Lingelsheim; S. trichophylla T. Tang.
Description: Species:
Shrubs 1–4 m. Branchlets 4-angled or subterete, along with petiole, rachis, pedicel, and calyx glabrous, puberulent, pilose or pubescent. Petiole 0.5-2 cm; leaf blade ovate, ovate-elliptic to lanceolate, or obovate to suborbicular, 1.5-8(-13) × 1-6 cm, adaxially glabrous, pilose, or pubescent, abaxially pilose, pubescent, villous, to glabrous, base cuneate to rounded, apex acute to caudate-acuminate or obtuse. Panicles erect, lateral, rarely terminal, 5-16 × 2.5-7 cm; rachis 4-angled or subterete. Flowers subsessile or short pedicellate. Calyx 1.5-2 mm. Corolla purplish red, purple, lilac, pink, to white, 0.8-1.8 cm; tube subcylindric or slightly funnelform, 0.6-1.7 cm; lobes oblong or ovate, spreading. Anthers purple or purple-black, rarely yellow, inserted on corolla tube at or to 3 mm from mouth. Capsule long elliptic to oblong-lanceolate, 0.7-2 cm, obviously lenticellate.
Subspecies:
1 Branchlets and inflorescence rachis ± 4-angled. (2)
+ Branchlets and inflorescence rachis subterete. (3)

2 (1) Branchlets and inflorescence rachis distinctly 4-angled, usually glabrous; anthers inserted on corolla tube 1-3 mm from mouth 8a subsp. pubescens
+ Branchlets and inflorescence rachis slightly 4-angled, hairy; anthers inserted on corolla tube to 1 mm from mouth 8b subsp. patula

3 (1) Calyx glabrous; anthers inserted on corolla tube to 1 mm from mouth 8c subsp. julianae
+ Calyx hairy; anthers inserted on corolla tube to 3 mm from mouth 8d subsp. microphylla

ssp. microphylla:
Branchlets and inflorescence rachis subterete. Calyx purple, mostly puberulent, sometimes densely

Taxon Family Spelling Checked

Syringa pubescens ssp. microphylla 'Superba' Oleaceae

INFO

Common Name: littleleaf lilac
Perennial Shrub
Height: 5-7ft. Spread: 10-14ft.
Flowers Deep pink
Synonomy: Syringa microphylla Diels

Description: Syringa pubescens subsp. microphylla commonly known as littleleaf lilac, is a dense, compact, mounded, spreading, deciduous, small-leaved shrub that grows to 6-7' tall and to 12' wide. Single, sweetly fragrant, lilac-pink flowers arranged in dense clusters (panicles to 4" long) bloom in May (St. Louis area). Elliptic to ovate, medium green leaves (to 2" long) are slightly hairy below. In comparison to the subspecies, 'Superba' features (1) deep pink blooms, (2) a more profuse May bloom, (3) sporadic rebloom in summer and/or fall, (4) a slightly broader habit (to 14' wide) and (5) better foliage resistance to powdery mildew. Synonymous with S. microphylla 'Superba'.

'Superba' is resistant to the common lilac diseases, especially powdery mildew. Leaf spot and blight are occasional problems. Stem borer, scale and leaf miner are occasional insect pests.

Cultivation: Easily grown in average, medium, well-drained soil in full sun. Tolerates light shade, but best bloom quality and disease resistance occur in full sun. Prefers rich, moist, neutral soils. Foliage needs good air circulation. Prompt removal of faded flower panicles before seed set will increase bloom for the following year. Prune as needed immediately after flowering.
'Superba' is resistant to the common lilac diseases, especially powdery mildew. Leaf spot and blight are occasional problems. Stem borer, scale and leaf miner are occasional insect pests.

Record Notes: Name checked with The Plant List, 7/19/2011. Cultivar name found used in the trade with internet search.

Syringa pubescens ssp. patula 'Miss Kim' Oleaceae !

INFO

Common Name: Manchurian lilac
Perennial Shrub
Height: 4-9ft. Spread: 5-7ft.
Flowers Lavender
Description: Species:
Shrubs 1-4 m. Branchlets 4-angled or subterete, along with petiole, rachis, pedicel, and calyx glabrous, puberulent, pilose or pubescent. Petiole 0.5-2 cm; leaf blade ovate, ovate-elliptic to lanceolate, or obovate to suborbicular, 1.5-8(-13) × 1-6 cm, adaxially glabrous, pilose, or pubescent, abaxially pilose, pubescent, villous, to glabrous, base cuneate to rounded, apex acute to caudate-acuminate or obtuse. Panicles erect, lateral, rarely terminal, 5-16 × 2.5-7 cm; rachis 4-angled or subterete. Flowers subsessile or short pedicellate. Calyx 1.5-2 mm. Corolla purplish red, purple, lilac, pink, to white, 0.8-1.8 cm; tube subcylindric or slightly funnelform, 0.6-1.7 cm; lobes oblong or ovate, spreading. Anthers purple or purple-black, rarely yellow, inserted on corolla tube at or to 3 mm from mouth. Capsule long elliptic to oblong-lanceolate, 0.7-2 cm, obviously lenticellate.

ssp patula:
Branchlets and inflorescence rachis slightly 4-angled, hairy; anthers inserted on corolla tube to 1 mm from mouth

Cultivar:
Deciduous shrub. This Manchurian lilac cultivar is a compact, upright, deciduous shrub which grows 4-7' tall with a similar spread. Lavender to ice blue, sweetly fragrant, single flowers are arranged in dense, terminal clusters (panicles to 3" long) which cover this shrub in May (St. Louis). Elliptic to ovate, dark green leaves (to 5" long) turn burgundy (often attractive) in autumn. A good selection for southern climates.

Cultivation: Zone: 3 to 8
Sun: Full sun
Water: Medium
Maintenance: Low
Flowers: Showy Flowers, Fragrant Flowers
Leaves: Good Fall Color
Wildlife: Attracts Hummingbirds, Attracts Butterflies

Syringa reticulata ssp. pekinensis Oleaceae !

INFO
Common Name: White Lilac
Perennial Tree
Flowers White
Native Range: China
Synonomy: Ligustrum reticulata, Syringa pekinensis
Description: Shrubs or trees 2-10(-10) m, glabrous. Petiole slender, 1.5-3 cm; leaf blade ovate to ovate-lanceolate or suborbicular. , 2.5-13 X 1-6(-8) cm, papery or thickly so, glabrous or rarely pubescent abaxially, base rounded, truncate, subcordate, or cuneate, apex acuminate to caudate-acuminate or acute. Panicles lateral, 1 to many paired on same branch and forming an inflorescence 5-20(-27) X 3-20 cm. Pedicel 0-2 mm. Calyx 1-1.5 mm. Corolla white, rotate, 3-4 mm; tube ca. as long as calyx or slightly longer. Capsule long elliptic to lanceolate, 1.5-2.5 cm, smooth or minutely lenticellate, apex blunt, acute to acuminate. Fl. May-Aug,fr. Aug-Oct. 2n = 46*.

Native habitat: Woods on slopes, valleys, along gullies; 600-2400 m. Gansu, Hebei, Henan, Nei Mongol, Ningxia, Shaanxi, Shanxi, N Sichuan.

Usually cultivated as an ornamental in N China.

Record Notes: Originally in records as Syringa pekingensis, which is a mis-spelling of S. pekinensis. According to Flora of China, the currently accepted species name is S. reticulata ssp. pekinensis.

Taxon Family Spelling Checked

Syringa yunnanensis Oleaceae !

INFO
Common Name:
Perennial Shrub
Flowers White to lilac-red
Native Range: China
Synonomy: Syringa tomentella subsp. yunnanensis (Franchet) Jin Y. Chen & D. Y. Hong
Description: Shrubs 2-5 m. Branchlets terete or slightly 4-angled, usually glabrous. Petiole 0.5-2 cm, glabrous; leaf blade elliptic, elliptic-lanceolate, to oblanceolate, 2 -8(-13) × 1-3.5(-5.5) cm, glabrous or abaxially rarely pubescent along veins, base cuneate or rarely subrounded, apex acute or short acuminate. Panicles erect, terminal, 5-18 × 3-12 cm; rachis and pedicel puberulent or rarely lanose. Pedicel 0.5-1.5 mm. Calyx 1-2.5 mm, glabrous or rarely lanose. Corolla white to lilac-red, 0.7-1.2(-1.7) cm; tube funnelform, 5-8(-13) mm; lobes oblong, spreading. Anthers yellow, usually inserted up to 2 mm from mouth of corolla tube. Capsule oblong, 1.2-1.7 cm, slightly lenticellate. In China: Fl. May-Jun, fr. Sep. 2n = 48.

Plants with glabrous calyces and puberulent inflorescence rachis have been recognized as f. yunnanensis, whereas those with lanate calyces and rachis as f. pubicalyx.

The combination Syringa tomentella subsp. yunnanensis (Franchet) Jin Y. Chen & D. Y. Hong (Novon 18: 316. 2008) was made after publication of the family treatment for the Flora of China.

Native habitat: Thickets, woods on slopes, gullies; 2000 -3900 m. SW Sichuan, SE Xizang, NW Yunnan.

Record Notes: Name checked with the Flora of China, 5/5/2009.

Syzygium buxifolium Myrtaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs or small trees. Branchlets blackish brown when dry, 4- or 6-angled. Leaves opposite or ternate; petiole ca. 2 mm; leaf blade broadly elliptic, elliptic, orbicular, obovate, or broadly obovate, 1-3 × 0.5 -2(-2.2) cm, leathery, abaxially slightly pale when dry, adaxially dark brown and not glossy when dry, abaxially glandular, secondary veins numerous, 1-1.5 mm apart, abaxially slightly raised, and adaxially inconspicuous or depressed, intramarginal veins 1-1.5 mm from margin and depressed or not, base broadly cuneate, cuneate, or obtuse, apex rounded, obtuse, or acute and sometimes with an obtuse cusp. Inflorescences terminal, cymes, ca. 1 cm, several-flowered. Flower buds ca. 3 mm. Hypanthium obconic, ca. 2 mm. Calyx lobes shallow wavy. Petals 4, white, distinct, ca. 2 mm. Stamens ca. 2.5 mm. Style as long as stamens. Fruit red turning purplish black, globose, 5-7 mm in diam. Fl. Jun-Aug, fr. Oct-Dec.

Leaves opposite; leaf blade broadly elliptic, elliptic, or sometimes broadly obovate, 1.5-3 × 1-2 cm, secondary and intramarginal veins adaxially flattened; branchlets 4-angled.

Sparse forests or scrub in mountains, hills; 200-1200 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Zhejiang [S Japan, Vietnam].

Syzygium smithii Myrtaceae !

INFO
Common Name: lilly pilly
Perennial Tree
Height: 60ft. Spread: 15-50ft.
Flowers White
Native Range: Australia
Synonomy: Acmena smithii
Description: Syzygium smithii grows as a tree to 20 m (60 ft) high by 5–15 m (15–50 ft) wide, with a trunk attaining a diameter of 70 cm (2 ft). The largest tree was recorded at Dingo Creek Flora Reserve, south of Tenterfield, being 30 m (98 ft) tall and a trunk 60 cm (2 ft) wide.

The trunk is sometimes buttressed. The bark is brown and scaled and flakes off easily. Its dark green shiny leaves are arranged oppositely on the stems, and are lanceolate or ovate and measure 2–10 cm (1–4 in) by 1–3 cm wide. The cream-white flowers appear from October to March, occurring in panicles at the end of small branches. Berries follow on, appearing from May to August, and are oval or globular and measure 0.8 to 2 cm in diameter, and range from white to maroon in colour. They are mildly acid, and have been described as somewhat lacking in taste.

A distinctive narrow leaved form with thin leaves 3–6 cm long is found along rainforest riverbanks from Sydney northwards through Queensland, and a small leaved form with leaves measuring 1.6–6 cm found in dryer rainforests from Colo Heights near Sydney north to the Bunya Mountains
A number of forms have been selected for cultivation.

Cultivation: Growth rate: Fast in suitable conditions, otherwise moderate.
Cautions: Not drought tolerant. Not suitable for poor drying soils. Fruits autumn/winter. Fruits self-set readily.
Tolerances: Generally hardy in suitable sites. Range of climates from temperate to tropical.
Sun demands: Enjoys good sun but tolerates part shade.
Soil demands: Heavier clay soils. Avoid poor and drying soils.
Water demands: Moderate

Record Notes: Name checked with The Plant List, Australian Plant Name Index 7/27/2011

Taxon Family Spelling Checked

Syzygium wilsonii Myrtaceae !

INFO
Common Name: Plum Satinash, Watergum, Powderpuff Lillypilly
Perennial Shrub
Height: 3 - 9ft.
Flowers Red Summer
Native Range: Northeastern Australia: Queensland
Synonomy: basionym: Eugenia wilsonii F.Muell.
Description: This species is endemic to the far north Queensland rainforests, from Ingham to Cooktown, in lowland rainforests from sea level to 600-700m, growing in relatively poor soils. S. wilsonii subsp. wilsonii is suitable for a range uses and locations from Sydney to Cairns. This species can be easily incorporated into any patio, courtyard or rainforest garden.

It is a small shrub 1-3 m tall with extremely attractive flowers and foliage with clusters of edible fruit that attracts wildlife. It has weeping branches with lanceolate reddish brown new foliage. Stiff narrow leaves to 18 cm x 5 cm, dark green and dull on upper surface and paler on underneath side of leaf. This species is the only one of the lillypillies to have red flowers. They have large, fluffy heads and flower from spring to summer. White clusters of ovoid shaped fleshy fruits.
Cultivation: Plant out in a shaded or sheltered position away from drying winds and full sun. It can also be used as a specimen shrub in a raised garden bed or against a wall. Keep the plant well mulched and composted, it's also responds well to regular fertilizing encouraging new growth. This species responds well to regular tip pruning increasing the number of flowers produced. To increase the impact of the plant try to incorporate with other species such as palm lilies, native gingers, ground covers and ornamental grasses. This will help create a structured garden with differing layers of height. This species can also be used as an under storey plant for a more established rainforest garden. This species is a particularly attractive potted plant making it accessible for people with smaller gardens and courtyards.
Propagation: The fleshy fruits can be easily propagated from the seed once fleshy fruit has been removed. Use a 50:50 mix of sharp sand and peat moss in a sterile seed raising tray or pot to strike seeds. Keep moist but not damp. This species can be successfully struck from cuttings; the best time to take cuttings is from November to March

Notes

1/30/2007 Tony Morosco — Location record for Conservatory of Flowers Bed Number 124B removed, since it is no longer jointly managed with SFBG. This was only location noted, so deaccessioned record.

3/8/2004 Tony Morosco — Accessioned from pot label. Possibly same as plants seen in Potted Plant Gallery.

Taxon Family Spelling Checked

Tagetes lemmonii Asteraceae !

INFO Common Name: Lemmon's marigold
Perennial Shrub
Height: 6ft.
Flowers Yellow Year round
Native Range: Arizona - Mexico
Synonomy: Tagetes palmeri, Tagetes alamensis
Description: Perennials, subshrubs, or shrubs 10–50(–100+) cm. Leaf blades 50–70(–120+) mm overall, lobes or leaflets (3–)5–7+, lance-elliptic to lanceolate, 15–30(–45) × 3–7(–10+) mm. Heads in ± corymbiform arrays. Peduncles 10–50 mm. Involucres 8–10 × 5–7 mm. Ray florets (3–)5–8+; laminae yellow, ± oblong, 9–15+ mm. Disc florets 12–30+; corollas 6–7 mm. Cypselae 5–6 mm; pappi of 0–5 lanceolate- to subulate-aristate scales 2.5–3+ mm plus 5+ lanceolate to oblong, ± erose scales 0.5–1 mm, distinct or connate, linear-oblong, ± erose scales 2–6+ mm. 2n = 24.

Flowering (Aug–)Sep–Nov. Moist sites, grasslands, scrublands, woodlands, cliffs, streamsides; 1400–2500 m; Ariz.; Mexico (Sinaloa, Sonora).

Taiwania cryptomerioides Cupressaceae !

INFO
Common Name:
Perennial Tree
Native Range: Taiwan
Synonomy: Taiwania flousiana Gaussen; Taiwania cryptomerioides var. flousiana (Gaussen) Silba; T. yunnanensis Koidzumi.

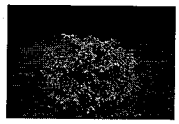

image of 1975 John Kipping

Description: Trees to 75 m tall; trunk to 3.5 m d.b.h.; bark brownish gray, cracking into long, irregular flakes; crown conical or broadly rounded. Leaves of old branchlets 1.5-8(-9) mm × 0.8-2.5 mm, stomata in 8-13 rows on adaxial, long side and in 6-9 rows on 2 abaxial flanks. Leaves of young trees and new branchlets borne at 40-70° to axis, bluish green, 1-2.5 cm × 1.2-2 mm, stomata in 3-6 rows on each surface. Pollen cones in clusters of 2-7; microsporophylls 10-36, each with 2 or 3 pollen sacs. Seed cones shortly cylindric to ellipsoid or narrowly so, 1-2.2 cm × 6-11 mm; cone scales 15-39, median scales broadly obdeltoid, 6-7 × 7-8 mm, claw ca. 2/5 × total length of scale. Seeds oblong-ovate, narrowly elliptic, or narrowly elliptic-obovate, 4-7 × 2.5 -4.5 mm (including wings 1-1.5 mm wide projecting 1 -1.5 mm beyond apex of seed). Pollination Apr-May, seed maturity Oct-Nov. 2n = 22*, 33.

image of 1983 G.C.Castor

Coniferous, broad-leaved, or mixed evergreen valley forests on acid, red, or brown soils in warm or warm temperate regions with high summer and autumn rainfall but drier winters, usually scattered and associated with Chamaecyparis formosensis, C. obtusa var. formosana, Cunninghamia lanceolata, Pinus wallichiana, or Tsuga dumosa, but sometimes forming pure stands; 500-2800 m. SE Guizhou (Leigong Shan), SW Hubei (Lichuan Xian, Maoba), SE Sichuan (Youyang Xian), Taiwan (Zhongyang Shan), SE Xizang (Zayü Xian), W Yunnan [N Myanmar]

A rare species in China, decreasing as a result of cutting for timber. It may attain an age of over 2000 years and, within its native range, can be used for afforestation. The wood is easily worked, and is used in building, making furniture and coffins ("Chinese coffin tree"), bridge and boat construction, and paper manufacture.

This taxon was lectotypified (Ohashi, H. & K. Ohashi

Tanacetum parthenium 'Virgo' Asteraceae !

INFO
Common Name: feverfewSelect Seed, Alamo, TX
Perennial Herbaceous
Height: 2ft.
Flowers White Jun, , Oct
Synonomy: Pyrethrum parthenium, Chyrsanthemum parthenium (L.) Sch.Bip.,
Matricaria parthenium L.
Description: From our source 6/25/2009, Select Seeds: Little button flowers of pure white with dark green leaves blooms in late spring to summer, reblooming in late summer when sheared back. Double forms similar to 'Virgo' have been grown for many years; in 1919 they were described as "old-fashioned" and were common in old yards.

Cultivation: Full sun; Soil: Regular, well-drained
Hardiness Zones: 4,5,6,7,8,9

Record Notes: Feverfew also in literature as Pyrethrum parthenium and Chrysantheum parthenium. Most commonly used name in the trade is C. parthenium. Flora Europea and GRIN list Tanacetum parthenium as currently accepted, 6/25/2009. Cultivar name found used in the trade with internet search, 6/25/2009.

Tanakaea radicans — Saxifragaceae X

INFO
Common Name:
Perennial Herbaceous
Native Range: China+japan
Description: Creeping evergreen perennial for the rock garden or trough, native to China and Japan. Oval, leathery leaves form a mat at ground level, between and over rocks. Clusters of small white flowers bloom in late spring. Moist, well-drained soil in shade.
Radical leaves subcoriaceous, green above, paler beneath, obtuse or subacute, 2-8 cm. long, 1-5 cm. wide, rounded or sometimes cordate at base, the petioles loosely coarse-hairy; scapes 10-30 cm. long, loosely long coarse-hairy; inflorescence densely flowered, erect or declined or nodding in fruit, 5-15 cm. long; flowers small, whitish, spetalous; capsules 3-4 mm. long; carpels 2, connate nearly the whole distance, dehiscent.

Taxodium distichum Cupressaceae !

INFO
Common Name: bald cypress
Perennial Tree
Height: 50-70ft. Spread: 20-45ft.
Native Range: Southern USA - Guatemala
Synonomy: Cupressus disticha
Description: Bald cypress is a long-lived, pyramidal conifer (cone-bearing tree) which grows 50-70' tall (less frequently to 125'). Although it looks like a needled evergreen (same family as redwoods) in summer, it is deciduous ("bald" as the common name suggests). It is native to southern swamps, bayous and rivers, primarily being found in coastal areas from Maryland to Texas and in the lower Mississippi River valley to as far north as the southeast corner of Missouri. In the deep South, it is a familiar sight growing directly in swampy water, often in large strands, with its branches heavily draped with Spanish moss. In cultivation, however, it grows very well in drier, upland soils. Trunks are buttressed (flared or fluted) at the base, and when growing in water, often develop distinctive, knobby root growths ("knees") which protrude above the water surface around the tree. Soft, feathery, yellowish-green foliage (1/4" long, flat needles in two ranks) turns an attractive orange/cinnamon-brown in fall. Rounded, wrinkled, 1 inch diameter, purplish-green cones mature to brown. Heavy, straight-grained, rot-resistant wood has been used for a variety of purposes including barrels, railroad ties and shingles. Closest relative is the dawn redwood (Metasequoia) which is also deciduous. Taxodium in Greek means resembling yews (Taxus) in reference to the flat needles. State tree of Louisiana.
Cultivation: Easily grown in average, medium to wet, moisture retentive but reasonably well-drained soils in full sun. Prefers moist, acidic, sandy soils, but tolerates a wide range of soil conditions ranging from somewhat dry soils to wet soils in standing water.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=18041 useage as 'accepted'. 2004-07-19.

Taxodium distichum var. imbricatum Cupressaceae !

INFO
Common Name:
Perennial Tree
Native Range: SE USA
Synonomy: Cupressus disticha Linnaeus var. imbricaria Nuttall, Taxodium ascendens Brongniart

Description: Trees to ca. 30 m; trunk to 2 m diam. Bark brown to light gray, typically somewhat thicker and more deeply furrowed than that of other varieties. Branchlets with leaves not in 2 ranks, mostly ascending vertically. Leaves ca. 3–10 mm, appressed and overlapping, mostly narrowly lanceolate, free portion not contracted or twisted basally. 2 n = 22.

Blackwater rivers, lake margins, swamps, Carolina Bay lakes, pocosins, and wet, poorly drained, pine flatwoods; 0–100 m; Ala., Fla., Ga., La., Miss., N.C., S. C.

The name Taxodium distichum (Linnaeus) Richard var. nutans (Aiton) Sweet has been misapplied to this taxon; the type of this name belongs to var. distichum (F. D. Watson 1985).

Record Notes: Previously in the record as T. ascendens. According to TROPICOS and Flora of North America this is a synonym, 7/8/2010.

Taxodium mucronatum Cupressaceae !

INFO
Common Name: sabino, Montezuma cypress
Perennial Tree
Height: 60-80ft. Spread: 20-40ft.
Native Range: Mexico
Synonomy: Taxodium distichum (L.) Rich. var. mucronatum; Taxodium huegelii C.Lawson

Description: As for the genus and Taxodium distichum. The chief differences between this species and T. distichum are (1) disjunct ranges; (2) slightly smaller and less variably-sized female cones in T. mucronatum; (3) "knees" are rare in T. mucronatum; (4) stomata are about equally distributed on both leaf faces in T. mucronatum, but are unequally distributed in T. distichum; and (5) T. mucronatum is not at all frost-hardy (Farjon 2005). Most of these difference could reflect ecological setting rather than relatively invariant character states. You will sometimes read that only T. distichum is deciduous, but in fact both species are annually cladoptosic; T. distichum tends to drop its foliage in the fall or winter, while T. mucronatum does so in the dry season. In parts of Mexico, those seasons coincide.
Cultivation: This beautiful Mexican native can grow in dry soils, however it will grow slower, or in well-watered areas like lawns. Montezuma cypress has a broad, spreading crown with strong, horizontal branches and delicate, weeping branchlets. The bark is shreddy. The roots of trees growing in standing water often send up conical projections ("knees"). Trees that experience periodic drying out, such as those growing along stream courses, apparently do not form knees.
Record Notes: Name checked with Tropicos on 6/11/2013 by Mona Bourell.

Height: 60ft.
Native Range: Europe - SW Asia
Description: Leaf: Evergreen needles, single, spirally arranged but appearing 2-ranked on shaded branches, 1 inch long, long pointed tip, needles typically angled upward forming a V-shape on branch, dark green and shiny above, yellow or pale green below with 8-10 stomatal rows.
Flower: Dioecious; Male is a globose strobili; female is a small stalked bud in leaf axils.
Fruit: Naked ovoid seed 1/4 inch long, surrounded by a bright red, fleshy aril, maturing in late summer, persistent through fall.
Twig: Light green in color, turning brown after several years; buds green with scales keeled.
Bark: Dark, usually red-purple, and scaly or somewhat peeling.
Form: Small tree or large shrub up to 60 feet tall with many limbed boles and a short trunk.
Cultivation: Due to its dense, dark green, mature foliage, and its tolerance of even very severe pruning
Record Notes: Name checked with The Plant List on 2/25/2013 by Mona Bourell.

Taxon | Family Spelling Checked

Taxus cuspidata — Taxaceae !

INFO
Common Name: Japanese yew
Perennial Tree
Native Range: Japan, Korea, Manchuria
Description: Evergreen dioecious tree to 20 m tall, 0.8 m in diam.; bark reddish brown, shallowly fissured. Branches and branchlets reddish brown, with longitudinal stripes continued to petioles. Leaves alternate, spirally arranged on erect branches, irregularly 2-ranked on lateral shoots; petiole ca. 1 mm long, glabrous; blade linear, apex with soft short spins, base obtuse, 10–20 mm long, 1.5–2 mm wide, dark green, with a prominent midrib on upper surface and a pale yellowish green band running along each side of a raised green midrib on lower surface. Flowers March to April, axillary on last year's shoots. Male strobili solitary on short pedicels enclosed with many membranaceous scales, globose, yellow, ca. 3 mm in diam., with about 10 stamens, each with 5 or 6 anthers under a peltate connective. Female flowers green, solitary, with one orthotropous ovule on a short peduncle, clothed with several imbricate scales. Fruits ripening in September to October, with one bony-coated seed surrounded by a thick fleshy red aril leaving a pore at apex, globose, ca. 8 mm in diam. Seeds globose-ovoid, blackish brown, apex subacute, ca. 6 mm long, 4.5 mm across.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=194886 useage as 'accepted'. 2004-07-19.

Taxon | Family Spelling Checked

Taxus wallichiana — Taxaceae !

INFO
Common Name:
Perennial
Native Range: Himalayas, China, SE Asia
Description: Trees or shrubs to 30 m tall; trunk to 1.3 m d. b.h.; bark variably colored, grayish brownish, reddish, or purplish, peeling off in strips or cracking and falling off as thin scales; winter bud scales early deciduous or some persistent at base of branchlets, triangular-ovate, with or without longitudinal ridges abaxially. Leafy branchlets ± flat in living state, 3-9 × 1.5-6 cm in outline. Leaves borne at (50-)60-90° to branchlet axis, subsessile or with petiole to 1 mm; blade dark green and glossy adaxially, paler abaxially, linear to lanceolate, gradually tapered distally, usually falcate, (0.9-)1.5-3.5(-4.7) cm × (1.5-)2-4(-5) mm, midvein slightly elevated adaxially, 0.1-0.2 mm wide, densely and evenly papillate abaxially, or with papillae scattered on midvein or in 1-several lateral rows adjacent to stomatal band, or midvein not papillate, stomatal bands pale yellowish, 0.6-0.9 mm wide, densely and evenly papillate, marginal bands 0.1-0.4 mm wide, base cuneate or attenuate, asymmetric, margin flat to revolute, apex gradually acuminate or abruptly tapered and indistinctly mucronate, mucro 0.1-0.5 mm. Pollen cones scattered along 2nd year branchlet axis, ± sessile or shortly pedunculate (peduncle ca. 0.5 mm), pale yellowish, ovoid, 5-6 × ca. 3 mm; bracts usually 6, broadly ovate, pale green; microsporophylls 8-14, each with (4 or)5 or 6(-8) pollen sacs. Seed-bearing structures borne toward distal end of branchlet axis. Aril red or orange when ripe, often ± translucent. Seed ovoid or obovoid, occasionally columnar-oblong, sometimes slightly flattened, 5-8 × 3.5-5 mm, usually with obtuse ridges (sometimes trigonous and 3-ridged); apex with small mucro; hilum elliptic to suborbicular or rounded-trigonous. Pollination Sep-Apr, seed maturity Aug-Dec.

Native habitat: Broad-leaved, coniferous, and mixed forests, thickets, deforested rocks, open slopes; 100 -3500 m. S Anhui, Fujian, S Gansu, N Guangdong, N Guangxi, Guizhou, W Henan, W Hubei, Hunan, Jiangxi, S Shaanxi, Sichuan, Taiwan, SE Xizang, Yunnan, Zhejiang [Bhutan, N India, ?Laos, Myanmar, Sikkim, Vietnam]

Taxon Family Spelling Checked

Taxus wallichiana var. mairei Taxaceae !

INFO
Common Name:
Perennial Shrub/tree
Native Range: N India, Laos, Myanmar, Vietnam, China, Taiwan
Description: From FOC description of species:
Trees or shrubs to 30 m tall; trunk to 1.3 m d.b.h.; bark variably colored, grayish brownish, reddish, or purplish, peeling off in strips or cracking and falling off as thin scales; winter bud scales early deciduous or some persistent at base of branchlets, triangular-ovate, with or without longitudinal ridges abaxially. Leafy branchlets ± flat in living state, 3-9 × 1.5-6 cm in outline. Leaves borne at (50-)60-90° to branchlet axis, subsessile or with petiole to 1 mm; blade dark green and glossy adaxially, paler abaxially, linear to lanceolate, gradually tapered distally, usually falcate, (0.9-)1.5-3.5(-4.7) cm × (1.5-)2-4(-5) mm, midvein slightly elevated adaxially, 0.1-0.2 mm wide, densely and evenly papillate abaxially, or with papillae scattered on midvein or in 1-several lateral rows adjacent to stomatal band, or midvein not papillate, stomatal bands pale yellowish, 0.6-0.9 mm wide, densely and evenly papillate, marginal bands 0.1-0.4 mm wide, base cuneate or attenuate, asymmetric, margin flat to revolute, apex gradually acuminate or abruptly tapered and indistinctly mucronate, mucro 0.1-0.5 mm. Pollen cones scattered along 2nd year branchlet axis, ± sessile or shortly pedunculate (peduncle ca. 0.5 mm), pale yellowish, ovoid, 5-6 × ca. 3 mm; bracts usually 6, broadly ovate, pale green; microsporophylls 8-14, each with (4 or)5 or 6(-8) pollen sacs. Seed-bearing structures borne toward distal end of branchlet axis. Aril red or orange when ripe, often ± translucent. Seed ovoid or obovoid, occasionally columnar-oblong, sometimes slightly flattened, 5-8 × 3.5-5 mm, usually with obtuse ridges (sometimes trigonous and 3-ridged); apex with small mucro; hilum elliptic to suborbicular or rounded-trigonous. Pollination Sep-Apr, seed maturity Aug-Dec.

Description of variety:
Leaves linear, usually falcate and 2-3.5 cm × 2.5-4 mm, thick, midvein of different color to stomatal band, not papillate, or with papillae scattered on midvein or in 1-several lateral rows adjacent to stomatal band, margin revolute.
Native habitat: Coniferous and mixed forests, thickets

Tecomaria capensis Bignoniaceae !

INFO
Common Name: Cape Honeysuckle
Perennial Shrub, Vine
Flowers Orange, Red
Native Range: South Africa
Description: Cape honeysuckle is a fast growing, scrambling shrub which may grow up to 2-3m high and spread more than 2.5m. This shrub is widely distributed throughout Northern Province, Mpumalanga, Swaziland, Natal, Cape coast and Mozambique. Tecomaria capensis is an evergreen plant in warm climate areas but loses its leaves in colder areas. It has pinnately compound leaves that have oval leaflets with blunt teeth. Flowering time for this shrub is very erratic and often it flowers all year round. Flowers vary from red, deep orange, yellow to salmon. Flowers are tubular and bird pollinated, attracting nectar-feeding birds, especially sunbirds.
Cultivation: Cape Honeysuckle grows equally well in full sun or part shade in well drained, compost enriched soil. The shrub is moderately frost hardy, requires protection from wind and performs well in both seaside and tropical conditions. Pruning will be required when growing as a shrub or hedge. This is best done after flowering, with hedges needing an annual hard prune. If required, crowded branches can be thinned in spring.
Propagation: Propagation is from seed and semi hardwood cuttings taken in summer, or by layering, something that the shrub does naturally.
Record Notes: Name checked in IPNI 5/4/2005.

Tecomaria capensis 'Aurea' Bignoniaceae !

INFO
Common Name: Yellow Cape Honeysuckle
Perennial Shrub, Vine
Height: 6ft.
Flowers Yellow May - Sept.
Cultivation: requires warmer temperatures and is slower growing than the typical species. Full light but not direct sun in summer. Moderate summer water, no water in winter. Prune after flowering.
Propagation: Propagation is from seed and semi hardwood cuttings taken in summer, or by layering, something that the shrub does naturally. Spreads by runners.

Perennial Shrub
Height: 18ft.
Flowers Yellow February
Native Range: Mexico
Synonomy: basionym: Senecio grandifolius Less.
Not Invasive
Description: Massive domes of yellow flowers the size of dinner plates on large shrubby plants with huge scalloped leaves to 14 inches.
Propagation: by cuttings or seeds
Record Notes: Name checked with The Plant List on 1/16/2013 by Mona Bourell.

division of plant in 29A

Bed 29A - Mesoamerican Cloud Forest Qty:1 Pl: Ckd:4/30/2014 Patrick Quinn
Center of E end of bed; Deep cut leaf form; Cuttings from plant in greenhouse.

Notes

11/30/2010 Mona Bourell	One plant from 0G3 deaccessioned, given back to Taylor at Univ. of Texas; none remain. Location removed.
11/23/2010 Olivier Thériault	Plant in bed 29A had no side branches at time of attaching accession tag. Since it is growing fast, the tag was not attached to the trunk to prevent girdling. Tag is in ground at base.
8/2/2010 Olivier Thériault	Plant was originally located at Conservatory of Flowers. Since it was reaching the ceiling, it was cut down and the large cutting was given to Don Mahoney. 3 cuttings were rooted from that piece; 1 planted in bed 29A, one kept in greenhouse in bed 0G3 and 1 kept by SFBGS plant sale as a stock plant. Plant has a deep cut leaf form, much different from other T.
7/29/2010 Mona Bourell	Olivier found plants that he had planted years ago in 29A and 0G3. It was originally at the Conservatory of Flowers, but given to us years ago. We originally received one cutting and divided it. One remains in greenhouse as stock plant.

Telanthophora uspantanensis Asteraceae !

INFO

Teline nervosa Fabaceae !

INFO

Common Name:
Perennial Shrub
Flowers Yellow
Native Range: Canary Islands
Synonomy: Rivasgodaya nervosa Esteve.

Description: Shrub to 4 m high. Branches ascending, the young are sericeu-Vilo. Leaves trifoliate, leaflets elliptic to oblong-lanceolate, obtuse and tipped mucronat. Inflorescence terminal raceme with 56 yellow flowers, calyx tube, sericeu-vilos, 8-10 mm. Blooms in January-May. Entomofila pollination.

Plant species considered in danger of extinction according to the National Catalogue of Species under Threat, and as such it is in need of a recovery plan. It is an endemic shrub to Gran Canaria that can reach two metres in height, with trifoliate leaves, with yellow flowers on contracted stalks. It can be found within the limits of the Protected Area of Pino Santo, on the dry rocky walls of San Jose del Alamo Riscos de Jimenez and Altos Labay, at an altitude of between 550 and 700 metres. It has a markedly rocky habitat and the dominant orientation is N and NW. Its altitude coincides with the potential contact area between thermophile woodland and the green forest, close presence of bushy leguminous shrubs can also be seen. It flowers between February and April and has striking yellow flowers. it was first discovered in the early 1970's in Barranco de Teror, and reproduces through the abundant seeds it produces. In his book, 'Flora of the Canary Islands' Davd Bramwell notes that its leaves can have both diuretic and calming effects. It is conserved through cultivation in the Viera & Clavijo Botanical Gardens and in La Orotava. Furthermore, the artificial population in the Gran Canaria Gardens is larger than all the natural populations together.

Record Notes: Name checked wilth The Plant List, 7/14/2011. Listed as "unresolved", may be a synonym for Rivasgodaya nervosa Esteve.

Tellima grandiflora Saxifragaceae !

INFO
Common Name: fringe cups, bigflower tellima
Perennial Herbaceous
Native Range: California - Alaska
Description: Plant hairy, with some glands; rhizome scaly; bulblets 0
Leaves basal and cauline, 5–40 cm, reduced upward; stipules ± 5 mm, membranous, ± sheathing, ciliate to toothed; petiole 3–30 cm; blade 2–10 cm, ovate, base cordate, clasping above, lobes shallow, teeth sharp
Inflorescence: spike-like raceme, 40–100 cm, generally 1-sided; flowers many; bracts scale-like; pedicels 2–5 mm
Flower fragrant or not; hypanthium partly fused to ovary; calyx lobes 2–3 mm, ± elliptic; petals 3–7 mm, lobes ± 5–7, linear, ± greenish-white to rose, ephemeral; stamens 10; pistil 1, ovary > half inferior, chamber 1, placentas 2, parietal
Fruit: capsule; valves 2, equal
Chromosomes: 2n=14
Ecology: Moist slopes
Elevation: < 2000 m.
Bioregional distribution: Northwestern California, Cascade Range, n Sierra Nevada, n&c Central Western California
Distribution outside California: to Alaska, Montana

Telopea 'Shady Lady Red' Proteaceae !

INFO
Common Name:
Perennial Shrub
Height: 9ft. Spread: 6ft.
Flowers Red
Parentage: T. speciossisima x T. oreades
Description: Stunning rich red blooms in spring. Prefers semi-shade to full sun. Plant in well drained acid soil in the garden or potting mix suitable for natives in tubs. If planting into pots, ensure Australian native potting mix is used. Fertilise with Australian native plant fertiliser only.

Cultivation: water well to establish, then keep moist in hot weather. Water tubs daily. Pick all flowers to maintain shape. Apply surface mulch and light dressings of blood & bone each Spring in the garden and use 'native' slow release fertiliser for tubs.

Record Notes: Name checked with The Plant List on 10/25/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon Family Spelling Checked

Telopea speciosissima Proteaceae !

INFO
Common Name: Waratah
Perennial Shrub
Height: 9ft.
Flowers Red
Native Range: Australia
Synonomy: Embothrium speciosissima
Description: The common name 'Waratah' was coined by Australian Aborigines and means 'red-flowering tree'. The botanical name 'Telopea' means 'seen from afar', and 'speciosissima' means 'most beautiful'.
upright shrub to about 3 metres but is often shorter. It usually grows as a single or few-stemmed plant until it is cut back by fire. The plant then regenerates from an underground lignotuber and may become multi-stemmed. The flowers occur in a tight cluster at the ends of the erect stems and, overall, the inflorescence can be 150mm or more in diameter. Large, leafy bracts occur at the base of the inflorescence. The leaves are large, leathery and may be irregularly serrated. They are up to 250mm long. The flower colour is almost universally blood red but some variations in the colour of the flowers and/or the bracts do occur and a number of these are in cultivation; eg. "Fire 'n' Ice" (red with white tips), "Songlines" (pink in bud, opening flame red), "Dreaming" (styles open white and mature to pink). The most famous colour variant is the pure white form known as "Wirrimbirra White". Some of these cultivars are selections from naturally occurring populations while others have been deliberately bred. Flowering occurs from mid spring to early su

image of © 2012 David Kruse-Pickler, SFBG2011

image of 1977 Strybing Arboretum Society

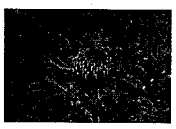

image of 1978 W. Anderson

Cultivation: The NSW Waratah grows naturally in patches of sandy loam on ridges and plateaus in the Sydney geological basin, the Central and South Coast districts and the Blue Mountains of New South Wales.
The Waratah is almost the ideal cut flower, being long lasting with flowers occurring terminally on long straight stems. The species is widely cultivated for the cut flower market both in Australia and overseas. Despite this the plant has not proven to be easy to cultivate under normal garden conditions. Some of the best plants in cultivation have been observed growing in deep sand or sandy loam with excellent drainage but assured moisture. A number of hybrids exist with T. speciosissima as one parent. A commonly grown hybrid

Taxon | Family Spelling Checked

Telopea truncata — Proteaceae !

INFO
Common Name: Tasmanium Waratah, Waratah
Perennial Tree
Height: 9ft.
Flowers Red Summer
Native Range: Australia: Tasmania
Synonomy: Embothrium truncatum Labill. nomenclatural synonym: Hylogyne australis Knight nom. illeg.
synonym: Telopea tasmaniana Ross
synonym: Telopea truncata (Labill.) R.Br.
synonym of: Telopea truncata (Labill.) R.Br.
Description: The beauty of this shrub in full flower with its crimson heads is not easily forgotten. Predominantly a subalpine plant it grows in snow gum woodland, sometimes extending to alpine shrubberies and can be up to 8m tall, but often much shorter, with rather few branches. The leaves, clustered towards the ends, are dark green above and paler below. Terminal flower heads 5-8 cm across consisting of 15-20 small, scarlet, deep red or very rarely yellow flowers are unmistakable and produce copious nectar which drips from the flower. There are persistent fruit cases 5-8 cm long.
Cultivation: In nature, the Tasmanian waratah grows on moist acidic soils in wet sclerophyll forest or subalpine scrubland at altitudes from 600 to 1200 metres. Though it requires good drainage, it also needs ample moisture to thrive, and soil with some clay content is said to be helpful. While lacking the density of flowers in the inflorescence that T.speciosissima exhibits, its much branched habit provides plenty of blooms which provide contrast to the attractive green foliage. Telopea truncata is an excellent candidate for gardens in cooler climates and has been grown successfully in France, Northern Spain, Vancouver in Canada and the United Kingdom.
Propagation: Seeds may be collected in the autumn and are easy to cultivate. Cuttings are also possible. Plants propagated from seed have a tap root; while those from cuttings do not. Propagation is best from seed which should germinate within 4-6 weeks if it is viable. No special pretreatment is necessary but seedlings are susceptible to damping off (a fungal disease) and need to be kept under observation. Seed from the yellow form will grow both red and yellow flowered plants.

Ternstroemia gymnanthera

Theaceae !

INFO
Common Name: Japanese Cleyera
Perennial Shrub
Height: 6-8ft.
Flowers Yellow, White
Native Range: Japan
Synonymy: Ternstroemia parvifolia Hu
Description: Shrubs 1.5-10(-15) m tall. Bark grayish brown, smooth. Young branches grayish brown; current year branchlets purplish red to reddish brown, glabrous. Petiole 0.7-1.3 cm, glabrous, adaxially grooved; leaf blade obovate, oblong-obovate, or broadly elliptic, (3-)4-12 × 1.5-5.5 cm, leathery, abaxially pale green becoming reddish brown when dry, adaxially dark green and shiny, both surfaces glabrous, midvein abaxially elevated and adaxially impressed, secondary veins 5-7 on each side of midvein and obscure on both surfaces, base cuneate, margin entire or apically sparsely serrate, apex acute to shortly acuminate and with an obtuse tip. Flowers axillary, solitary or several clustered on leafless branchlets, 1-1.8 cm in diam. Pedicel 1-1.5 cm, recurved. Male flowers similar to bisexual flowers but ovary reduced to a pistillode. Bisexual flowers: bracteoles triangular to triangular-ovate, 1.5-2.5 mm, margin glandular dentate, apex acute; sepals ovate to long ovate, 4-7 × 3-4 mm, glabrous, margin glandular dentate, apex rounded; petals pale yellow, obovate, 6-9 × 4-6 mm, apex rounded and retuse; stamens 4-5 mm; anthers oblong, longer than filaments; ovary ovoid, 2-loculed with 2 ovules per locule; style 1-3 mm, apically 2-lobed. Fruit purplish red when mature, globose, 1-1.5 cm in diam., 2-loculed with 1 or 2 seeds per locule. Seeds reniform, ca. 6 × 4 mm. Fl. May-Jul, fr. Sep-Nov.

Native habitat: Forests, thickets; 200-2800 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, Sichuan, Yunnan, Zhejiang [Bhutan, Cambodia, India, Laos, Myanmar, Nepal, Thailand, Vietnam].

The name Ternstroemia gymnanthera has often been mistakenly applied to other Ternstroemia species in the literature.

Cultivation: Cleyera grows best in a well drained acidic soil. Sun to Shade.

Ternstroemia kwangtungensis

Theaceae !

INFO

Common Name:
Perennial Tree
Native Range: China
Description: Shrubs or trees, 2–10 m tall. Bark grayish brown to blackish brown, smooth. Young branches grayish brown; current year branchlets reddish brown, glabrous. Petiole 1–2 cm, stout, glabrous; leaf blade broadly elliptic to obovate, (5–)8–11(–13) X (3–)4–6.5 cm, thickly leathery, abaxially pale green and densely reddish brown or brown glandular punctate, adaxially dark green and shiny, both surfaces glabrous, midvein abaxially elevated and adaxially flat or slightly impressed, secondary veins 5–7 on each side of midvein and obscure on both surfaces or adaxially visible, base broadly cuneate to obtuse, margin entire or rarely apically sparsely serrate, apex abruptly shortly acute and with an obtuse tip. Flowers axillary, solitary. Pedicel 1.5–2 cm, slightly recurved, glabrous. Male flowers: bracteoles ovate, triangular-ovate, or ovate, 4--5 X ca. 3 mm, margin sparsely glandular dentate; sepals ovate to suborbicular, 6--8 X 6–8 mm, glabrous, margin glandular dentate, apex rounded; petals white, obovate to oblong-obovate, ca. 10 X 8 mm, apex rounded and retuse; stamens numerous, ca. 6 mm; anther ovate, ca. 3 mm; pistillode very small. Bisexual flowers not seen. Fruit compressed-globose, 1.5–1.8 X 1.6–2 cm, 3–4(–5)-loculed with 1 seed per locule; pedicel 1.5–2 cm, ca. 3 mm thick; persistent bracteoles triangular-ovate, ca. 3 X 4 mm; persistent sepals suborbicular, 6–7 X 6–7 mm; persistent style 1–2 mm, apically 3- or 4(or 5)-lobed. Seeds subreniform, 7–8 X ca. 6 mm. Fl. May–Jun, fr. Oct–Nov.

Tetracentron sinense Tetracentraceae !

INFO
Common Name:
Perennial Tree
Native Range: Nepal, SW & C. China, N. Burma
Description: Trees to 40 m tall, 1–1.5 m d.b.h, glabrous. Branchlets grayish brown; bud ca. 1 cm. Stipule narrowly oblong, ca. 1 cm. Petiole 2–4 cm; leaf blade broadly ovate, 7–16 × 4–12 cm, papery, abaxially paler, base cordate to rarely truncate rounded, margin serrulate, apex acuminate; palmate veins 5–7. Inflorescences 6–15 cm, short pedunculate, 80–125-flowered but some aborted by anthesis. Floral subtending bracts 0.3–0.5 × 0.4–0.7 mm. Flowers yellowish green, sessile, 1–2 mm in diam. Sepals ovate-orbicular, 1–2 mm, margin entire, apex rounded. Stamens exserted; filaments subterete to slightly flattened, 1.5–3 mm; anthers 0.4–0.8 mm, locules lateral, each theca dehiscent by a lateral slit, connective truncate-rounded at apex. Carpels ca. 1.5 mm at anthesis. Styles at first erect and connivent, becoming recurved at anthesis, subulate; stigma along the ventral surface of the style. Fruit brown, follicles 2.5–5 mm, dehiscence loculicidal, persistent style pointing toward follicle base due to expansion of follicle ventral side. Seeds 4–6 per follicle, spindle-shaped, 2–3 mm, compressed, short winged at each end. Fl. Apr–Jul, fr. Jul–Oct. 2n = 48

Along streams or forest margins in broad-leaved evergreen forests and mixed evergreen-deciduous forests; 1100–3500 m. S Gansu, Guizhou, SW Henan, W Hubei, NW and SW Hunan, S Shaanxi, Sichuan, S and SE Xizang, Yunnan [Bhutan, NE India, N Myanmar, E Nepal, N Vietnam].

This species is expected to be found in both N Guangxi (Yuecheng Ling) and Sikkim.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Tetradium daniellii Rutaceae !

INFO
Common Name:
Perennial Shrub/tree
Flowers White
Native Range: Tibet, China, Korea
Synonomy: Evodia daniellii
Description: Shrubs or trees, to 20 m tall. Leaves 15-44 cm, 5-9(or 11)-foliolate; leaflet blades broadly ovate to lanceolate or rarely elliptic or elliptic-oblong, 5-18.5 × 2.5-10.5 cm, abaxially sometimes ± glaucous and not papillate, secondary veins 7-14 on each side of midvein, reticulate veinlets abaxially usually inconspicuous, base in lateral leaflets narrowly cuneate, subtruncate, subrounded, or subcordate and in terminal leaflet narrowly cuneate, cuneate, or occasionally rounded, margin subentire to crenulate, apex acuminate. Inflorescences 3.5-19 cm. Flowers (4 or)5-merous. Sepals 0.5-1.5 mm. Petals white or whitish but drying whitish or pale brown, (2.5-)3-5 mm, outside glabrous, inside sparsely or sometimes densely pubescent or villous. Ovary pubescent between carpels, otherwise ± densely pubescent to glabrous; ovules 2 per carpel, superposed. Fruit (including abortive carpels, if any) usually 5-carpelled; follicles narrowly pyriform, 5-11 mm, sparsely to ± densely spreading pubescent, apex beaked; endocarp glabrous. Seeds 2 per follicle, superposed, black, ovoid to ellipsoid, shiny, attached in dehisced fruit to axile strip of pergamentaceous pericarp tissue; basal seed sterile, usually 1.5-3.5 mm, containing what appears to be endosperm but no embryo; apical seed fertile, 2.5-4 mm; seed coat sclerenchymatous, lacking spongy tissue, in fertile seed thick and resistant to breakage, in sterile seed thin and brittle. Fl. Jun-Aug, fr. Aug-Nov. 2n = 76, 78.

Tetranema roseum 'Alba' Plantaginaceae !

INFO
Common Name: white Mexican violet
Perennial Herbaceous
Flowers White
Description: 'Alba' produces white flowers.

Tetranema roseum is an evergreen perennial with obovate, dark green leaves. Produces trumpet-shaped, 2-lipped, lilac or mauve flowers with darker markings on the stems. In general, Tetranema is an evergreen perennial, shrub-like in appearance, that thrives under moist, shady circumstances at high altitudes (up to 4,000 feet). Native to Mexico and Guatemala, this plant is grown for its showy, trumpet-shaped flowers that are produced over a long period of time during the summer. Flowers are either mauve, violet, or lilac colored and leaves are leathery and elliptical and scalloped.
Cultivation: Soil should be well-drained. If grown as a houseplant, provide filtered light with moderate to high humidity. During the growing season, water freely and fertilize monthly with a balanced fertilizer. Repot in spring.
Record Notes: Name checked with The Plant List on 3/19/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Tetrapathaea tetrandra Passifloraceae !

INFO
Common Name: New Zealand Passion Flower; Kohia
Perennial Vine/Liana
Native Range: New Zealand
Synonomy: Passiflora tetrandra Banks ex DC.
Description: Vigorous, dioecious, high-climbing vine, glabrous except for slightly hairy young stems. Lvs simple; petioles (0.8)-1-2 cm long, eglandular; stipules minute or 0; lamina (4)-5-12-(14) × (1.8)-2-4-(5.5) cm, lanceolate to narrow-ovate or elliptic, coriaceous, dark glossy green above, entire, acute to acuminate. Fls (1)-3-4 in cymes, fragrant. Pedicels 5-15 mm long. Bracts ± subulate, caducous. Hypanthium 0. Perianth 4-merous; segments 5-6 mm long, ± oblong, yellowish green; corona threads 2.5-3.5 mm long. ♂ fls with 4 stamens; filaments 5-6 mm long forming a short androphore bearing an abortive ovary. ♀ fls with short staminodes. Ovary glabrous; styles (2)-3, c. 2 mm long. Fr. (2)-2.5-3 cm diam., subglobose or broad-ellipsoid, orange; pulp reddish, sparse. Seeds 3-7 mm long, flattened, wrinkled.
FL Jul-Mar.
N.; S.: south to Banks Peninsula, absent from Westland.
Lowland areas, in indigenous forest clearings, margins and remnants.
Endemic.
Allan (1961) placed this sp. in the monotypic Tetrapathaea as T. tetrandra. Hutchinson, J., The Genera of Flowering Plants 2 (1967), stated that the distinguishing characters, tetramerous fls and dioecism, did not justify its generic separation from Passiflora. Green, P. S., Kew Bull. 26: 553-554 (1972), retained the sp. in Passiflora but erected subgen. Tetrapathaea (DC.) Green for it on the basis of the tetramerous fls, the absence of an operculum, and the lack of petiolar glands.

Tetratheca ericifolia 'Heathland Gem' Tremandraceae !

INFO
Common Name: Black-eyed Susan
Perennial Shrub
Height: 2ft. Spread: 2ft.
Flowers Purple, Pink Winter and spring
Native Range: Southeast Australia
Description: A small, fine-stemmed, ground-hugging shrub, that rarely grows to more than 30cm. The leaves are small, narrow, and are placed in small groups of 3-6 around the stem. The flowers are comparatively large, with four rather floppy petals, and minute brown sepals with very small reddish-brown hairs.
Habitat: Sandy soils, in heath and open forest. Koala Blooms 2004 release.
Cultivation: Plant in sun with good drainage. Appreciates some water during extended dry periods. Hardy to mid -20s deg. F.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Teucrium betonicum

Lamiaceae !

INFO
Common Name: Madeira germander
Perennial Shrub
Height: 4ft. Spread: 4ft.
Flowers Violet rose
Native Range: Portugal: Madeira Island
Description: from Annie's Annuals:
Where has this amazing shrub been all my life? EASY, carefree, heat & drought tolerant, evergreen & deer resistant & completely beautiful in bloom! A glorious multitude of showy 6"violet-rose spikes are held upright from top to bottom on a substantial 4' x 4' rounded form from May thru July. It keeps its shape very well needing only a bit of pruning after a few years. Pleasing, heart-shaped, sage green foliage. A superb choice for any sunny garden, moist or dry – do try it! Well drained soil & an annual 2" layer of compost for best show.

Cultivation: Rich, well drained soil in a sunny spot throughout the year. In winter keep plants slightly drier at a minimum of some 10°C.
Record Notes: Name checked with The Plant List on 4/17/2012 by Mona Bourell.

Teucrium capitatum var. chamaedrifolium Lamiaceae !

INFO
Common Name: felty germander
Perennial Shrub
Native Range: Mediterranean - Middle East
Synonomy: Teucrium polium
Description: a sub-shrub and herb native to the Mediterranean region and the Middle East. Its flowers are small and range from pink to white, and its leaves are used in cooking and for medicine, particularly for the treatment of stomach ailments. It has also shown some promise in the treatment of visceral pain. In traditional Persian medicine, T. polium (locally called 'kalpooreh') is used as an anti-hypertensive, anti-bacterial, carminative, anti-nociceptive, anti-inflammatory, anti-diarrhea, anti-diabetes and anti-convulsant agent. A scientific study in 2003 failed to find any benefit to diabetics, even though it is commonly used in the mideast for this purpose. A scientific study in 2006 found that it does have anti-nociceptive and anti-spasmodic effects. Caution should be applied with use of this herb due to its known liver and kidney toxicity.
Flw - Jun July, Aug, Sep, Oct
Record Notes: Name checked with Tropicos on 8/14/2014 by Mona Bourell. The Plant List has it as a synonym of T. polium.

Teucrium chamaedrys Lamiaceae !

INFO
Common Name: wall germander
Perennial Shrub
Height: 0.75-1ft. Spread: 1-2ft.
Flowers Rosy lavender to pinkish purple
Native Range: Europe - Caucasus
Description: Wall germander is a shrubby, woody-based, clump-forming, broad leaf evergreen which is grown ornamentally for its attractive, aromatic, evergreen foliage. Features 3/4", oval, scalloped, shiny dark green leaves on numerous ascending and spreading stems which collectively form a mound of foliage 12-15" tall. Leaves resemble miniature oak leaves (chamaedrys means "ground oak" in reference to the leaf shape and ground cover habit). Whorls of two lipped, tubular, pink to purple (less frequently white) flowers (typical mint family) appear in terminal clusters in late spring to early summer. Leaves were formerly used in a variety of medicinal treatments.

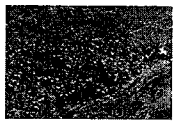

image of 1973 V. Reiter

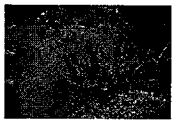

image of 1975 V. Reiter

Cultivation: Sun: Full sun
0 %"Water: Dry to medium
Maintenance: Medium
Tolerates: Dry Soil, Drought, Deer, Rabbits
Uses: Hedge

Best grown in average, dry to medium moisture, well-drained soils in full sun. Tolerates poor soils as long as drainage is good. Pinch (or shear if leggy or scraggly) stems after flowering to promote bushy, compact growth

Teucrium cossonii ssp. cossonii Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 0.25-0.5ft. Spread: 2-3ft.
Flowers Lavender-purple
Description: Teucrium cossonii (Majorcan Teucrium) - A low-growing perennial that forms a mat 4-6 inches tall and spreads 2-3 feet. Gray leaves, that are whitish underneath, densely clothe the thin branches. Lavender-purple flowers bloom among the foliage in the spring and fall.

Cultivation: Sun, low water needs. Hardy to 0-10° F. A great small scale groundcover. Attracts bees.
Record Notes: Name checked with The Plant List on 8/19/2013 by Mona Bourell.

Teucrium marum Lamiaceae !

INFO
Common Name: cat thyme, germander, kitty crack
Perennial Shrub
Flowers Pink
Native Range: W Mediterranean
Synonymy: Chamaedrys marum (L.) Moench
Description: Cat thyme (Teucrium marum) is a close relative of germander; despite what its name suggests, it is not a thyme. Its small, oval leaves give it a thyme-like appearance, but the musty scent is quite unlike the delicate aroma of thyme, cat thyme is a mounding, tender perennial with grey-green leaves tipped by fragrant pink flowers in summer.
Cat thyme, a native of Spain and the Western Mediterranean, will live through the winter in the open, on a dry soil and in a good situation, when the frosts are not severe, though it is frequently killed in hard winters if unprotected by mats or other covering. Older plants can shrub 3 or 4 feet high if grown in a mild climate.
It has oval leaves, broader at the base, downy beneath, with uncut margins. It is in leaf all year.
The flowers, appearing between July and September, are in one-sided spikes, the corollas are crimson in color.
The leaves and younger branches when fresh, on being rubbed emit a volatile, pungent, aromatic smell, which excites sneezing, but in taste they are somewhat bitter, accompanied with a sensation of heat.
Some, but not all cats prefer it to catnip and will corkscrew themselves into the plant in ecstasy.

Record Notes: Name checked with The Plant List on 8/13/2013 by Mona Bourell.

Teucrium pyrenaicum Lamiaceae !

INFO Common Name:
Perennial Herbaceous
Native Range: Pyrennes
Description: This species of germander is native to the Pyrenees Mountains where it primarily occurs in limestone soils. It is a low-growing, woody-based, herbaceous perennial or shrublet which typically grows to 3-10" tall but spreads by trailing stems which root as they go to form a foliage mat 4-8" wide. Whorls of 2-lipped, lavender and cream flowers (typical mint family) appear in terminal clusters on upright flowering stems (to 10" tall) in late spring to early summer. Tiny, toothed, rounded, light green leaves (to 3/4" wide and long).

Cultivation: Best grown in average to somewhat gritty, dry to medium moisture, well-drained soils in full sun. Tolerates poor soils as long as drainage is good.
Record Notes: Name checked with TROPICOS, 11/15/2010.

Thalictrum minus Ranunculaceae !

INFO Common Name: small meadowrue
Perennial
Native Range: Japan
Description: Mostly glabrous perennial 30-100 cm. high; stems usually striate, leafy; lower leaves rather large, short-petiolate or sessile, 2-4 times ternate, the stipules undulately toothed, usually stipellate, the leaflets oblong, obovate or flabellate-obovate, 1-3 cm. long, 8 -20 mm. wide, rounded to sometimes cordate, 2- to 3-lobed, green above, glaucous beneath; panicles rather large; flowers yellowish-green, the pedicels usually rather long; sepals caducous, 3-nerved, oblong; anthers broadly linear, about 3 mm. long, mucronate; achenes 2 -6, narrowly obovate, about 3 mm. long, sessile, few-nerved on each side, the style very short, the stigma ovate-deltoid.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=18672 useage as 'accepted'. 2004-07-19.

Taxon Family Spelling Checked

Thalictrum polycarpum — Ranunculaceae !

INFO
Common Name: Meadow Rue
Perennial Herbaceous
Native Range: Western North America
Synonomy: Thalictrum fendleri Engelmann ex A. Gray var. polycarpum Torrey
Description: Roots fibrous. Stems erect, 6-18(-20) dm, glabrous. Leaves mostly cauline, petiolate. Leaf blade 3 -4×-ternately compound; leaflets orbiculate to obovate, apically 3-cleft or 3-parted, divisions undivided or shallowly 3-lobed, 15-40 mm wide, lobes rounded or somewhat acute, surfaces glabrous or glandular. Inflorescences terminal, panicles, many flowered. Flowers: sepals whitish to purplish, elliptic to ovate or lanceolate, 2-4(-5) mm; filaments whitish to pinkish, 3-6 mm; anthers (1.4-)2-4 mm, distinctly apiculate. Achenes 10-15, spreading in globose heads, not reflexed, sessile or nearly so; stipe 0-0.6 mm; body nearly globose to obovoid to obliquely obovate, laterally compressed, somewhat inflated and papery, 4-7(-8) mm, glabrous to glandular, often with 1 or 2 primary veins on each side, veins sinuous, branched, anastomosing-reticulate; beak 2-4 mm.

Flowering mid-late spring (Apr-Jun). Streamsides and other moist places, forests, and open woodlands; 600 -3100 m; Calif., Nev., Oreg., Utah; Mexico (Baja California).

Thalictrum polycarpum is the only species in sect. Heterogamia with anastomosing-reticulate veins on the achene.

The stems and roots of Thalictrum polycarpum are considered poisonous when ingested by humans or cattle; Native Americans used this species medicinally as a wash for headaches, as an applications for sprains, and as a universal charm and panacea (D. E. Moerman 1986).

Thalictrum ramosum — Ranunculaceae X

INFO
Common Name:
Perennial
Native Range: China
Description: Plants 12--45 cm tall, glabrous. Rootlets never enlarged. Stems branched, sulcate. Leaves both basal and cauline; petiole 7--9 cm; leaf blade 2- or 3-ternate, 7--15 cm; leaflet blade broadly ovate, broadly obovate, or orbicular, 0.7--2 × 0.5--1.5 cm, herbaceous, base rounded or subcordate, apex obtuse, inconspicuously 3-lobed; lobes acute at apex; veins raised abaxially, flat adaxially. Inflorescence monochasial. Pedicel filiform, 5--10 mm. Sepals 4, early deciduous, white, tinged purplish, ovate, ca. 2 mm. Filament base filiform, 4--6 × as long as anther, apex narrowly oblanceolate; anther tinged yellow, ca. 0.7 mm. Carpels (6--)8--16; style recurved, slender, ca. 2 mm, slightly longer than ovary. Achenes sessile; body narrowly ovoid or lanceolate, 3.5--4.5 mm; veins ca. 8. Fl. Apr, fr. May--Jun.

* Scrub, hills; 500--1000 m. Guangxi, Hunan, Sichuan.

This species is similar to Thalictrum fortunei, but differs in having small sepals and many narrowly ovoid achenes; it is also similar to T. javanicum, which differs in being taller and having inflorescences much branched and many flowered, sepals long, and filaments broader than anthers.

Thalictrum ramosum is used medicinally.

Taxon Family Spelling Checked

Thamnocalamus tessellatus Poaceae !

INFO
Common Name: Bergbamboes, South African mountain bamboo, Berg Bamboo
Perennial Graminoid
Height: 15-20ft.
Native Range: South Africa
Synonomy: Arundinaria tessellata (Nees) Munro, Nastus tessellatus Nees
Description: "Bergbamboes" is the Afrikaans name for this unique bamboo. It's the only bamboo native to South Africa where at one time the canes were used in Zulu shields as well as shafts for arrows and spears. It has a beautiful upright habit with persistent cane sheaths after shooting. This gives the plant an unusual and ornamental appearance. Forming a tight clump this bamboo is perfect for a hedge or planted alone. It can be trimmed to a desired height if 16 feet is too tall.
Cultivation: Maximum height 15 feet; Maximum diameter: 1 inch
Hardiness 5° F; USDA Zone recommended 8
One of best clumping bamboos for a sunny location. It is also more upright than our other hardy clumping bamboos. From South Africa, where it is called Bergbamboes, or mountain bamboo. It is a very unusual bamboo with very thick culms in relation to its height. It is the only African bamboo hardy enough to grow in the Pacific Northwest. As you can see from the pictures it forms a tight clump, unlike the open clump reported in the ABS source list.
Record Notes: Corrected name from "Thamnocalamus tesselata" to "Thamnocalamus tessellatus" per TROPICOS database. 10/26/2005.

Taxon Family Spelling Checked

Thamnochortus bachmannii Restionaceae !

INFO
Common Name: steenbok reed
Perennial Graminoid
Native Range: South Africa: Cape
Synonomy: Thamnochortus sulcatus Mast.
Description: perennial-Dwarf shrub, Restioid- Ht 0.7 - 0.8 m. Alt: 2 - 400 m. Distribution: NC, WC Thamnochortus bachmannii is an evergreen, dwarf perennial restio that grows up to 1 m tall with a width of about 0.5 m. The culms (leaves) form a tufted, compact plant having a pleasing structural shape. It commonly grows in a dense population, displaying its bronze-brown inflorescence to full advantage. Flowerheads are made up of spikelets. Male flowerheads are identified by their pendulous spikelets whereas, the female spikelets are upright. The male flowers develop earlier than the female flowers so that there is plenty ripe pollen available when the female flowers reach maturity. Small papery, golden seeds are produced in spring.

Thamnochortus insignis Restionaceae !

INFO
Common Name: Dekriet, Thatching reed, Albertinia thatching reed
Perennial Graminoid
Height: 7.5ft. Spread: 9ft.
Flowers Brown Summer
Native Range: South Africa
Not Invasive
Description: Plants of Thamnochortus insignis are tall, grass- or reed-like tussocks with a diameter of 500 mm to 1 metre at the base and a spread of 3 metres or more at the top and up to 2,5 m tall. Male and female plants are separate and very similar when they are not flowering.

image of © 2009 Mona Bourell, SFBG2006-0623

Thamnochortus insignis flowers in summer (January-February) and produces large amounts of seed in autumn (April-May). The plants are at their most ornamental from about 2 months before flowering to a few months after producing seed.

Thamnochortus insignis grows in dense stands in the southern Cape around Albertinia. It can now be found along the roadsides from Port Elizabeth to the Cedarberg, where the seed has been distributed by the trucks carrying the thatching material.

The plants are wind pollinated with the male inflorescences in small tassels swaying in the wind, while the female flowers are at the base of medium sized bracts, which catch the pollen from the air and funnel it towards the small fringed styles of the female flowers. The male flowers produce pollen in such large amounts that female bees come and collect the pollen to use in the beehives and during a still day the droning of the bees around the plant can be heard clearly.

The seed comes in the form of a tiny nutlet inside the old flower, which by this stage has formed two small wings. This helps the wind to carry the seeds away from the plant. The seeds are produced in very large quantities by each female plant, but are not all viable; a large number of nutlets are empty inside. Why the plants expend all this energy to produce sterile seeds is not clear, but is particular to this genus as well as to the genus Elegia

Thamnochortus rigidus Restionaceae !

INFO
Common Name:
Perennial Graminoid
Height: 2ft. Spread: 2ft.
Flowers Brown
Native Range: South Africa
Description: A showy member of the great restio alliance, easily distinguished from Elegia and its other better-known cousins. It produces two separate kinds of shoots. The vegetative or sterile shoots are spreading to prostrate and intricately branched, making a springy net of wiry branchlets, all under 2' high. The branchlets are dark green overall but have brightly contrasting, silvery bracts. Separate flowering stems rise 3-4' in summer, carrying clusters of chaffy brown flower spikelets. Those of the male plants droop gracefully. This is an attractive plant for any moist spot around the garden, and for large containers. Sun or light shade near the coast, part shade inland, well drained soil, constant moisture. Hardy to around 20oF. Another from the remarkable ranks of the S. African Restios, this forms clumps of finely fretted glossy green foliage and stunning heads of glistening silvery seed heads atop stems to 50", for full sun and moisture-rich soil.

Cultivation: full sun and moisture-rich soil.

Thuja koraiensis — Cupressaceae !

INFO
Common Name:
Perennial Shrub/tree
Height: 10-30ft.
Native Range: Korea
Description: Native to Korea and the extreme northeast of China (Changbaishan). Its current status is poorly known; the small population in China is protected in the Changbaishan Nature Reserve, as is the small population in Soraksan Nature Reserve in northern South Korea, but most of the species' range in North Korea is unprotected and threatened by habitat loss.
It is an evergreen shrub or small tree growing to 3-10 m tall. The foliage forms flat sprays with scale-like leaves 2-4 mm long (up to 15 mm long on strong-growing shoots), matt dark green above, and with broad, vivid white stomatal wax bands below. The cones are oval, yellow-green ripening red-brown, 7-11 mm long and 4-5 mm broad (opening to 6-9 mm broad), with 8-12 overlapping scales.[2]
It is occasionally grown as an ornamental tree for the contrast between the green upper and bright white lower sides of the foliage, though planting is limited by the low availability of seeds.

Thuja occidentalis 'Woodwardii' Cupressaceae !

INFO
Common Name:
Perennial Shrub
Height: 4-10ft. Spread: 8-10ft.
Description: Thuja occidentalis, commonly known as American arborvitae, Eastern arborvitae, Eastern white cedar or Northern white cedar, is a dense, conical to narrow-pyramidal (sometimes maturing to broad-pyramidal), often single-trunked, evergreen tree that is native to eastern and central Canada south to northern Illinois, Ohio and New York with scattered populations further south in the Appalachians to North Carolina. 'Woodwardii' is a compact globular-spreading form that typically grows to 4-5' tall with a spread to 8' wide over the first 10 years. It may eventually mature to 8-10' tall and to 15' wide. Plants display attractive scale-like rich green foliage in flattened sprays. Seed cones, if present, are not particularly showy.

Cultivation: Sun: Full sun to part shade
Water: Medium
Maintenance: Low

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 4/17/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon Family Spelling Checked

Thuja plicata Cupressaceae !

INFO
Common Name: western redcedar
Perennial Tree
Native Range: California - Alaska
Description: Trees to 50(--75) m, sometimes stunted in harsh environments; trunk to 2(--5) m diam., often buttressed at base; crown conical. Bark reddish brown or grayish brown, 10--25 mm thick, fibrous, fissured. Branches arching, branchlets pendent. Leaves of branchlets (1--)3--6 mm (sprays sometimes bearing only very small leaves), apex acute, with white markings on abaxial surface when fresh, glossy green on adaxial surface of branchlets. Pollen cones 1--3 mm, reddish. Seed cones ellipsoid, 10--14 mm, brown; fertile scales 2--3 pairs, each with evident, nearly terminal, deltate projection. Seeds 8--14 per cone, 4--7.5 mm (including wings), reddish brown. 2 n = 22.
On various substrates, commonly in moist sites, mixed coniferous forests, usually not in pure stands; 0--1500(--2000) m; Alta., B.C.; Alaska, Calif., Idaho, Mont., Oreg., Wash.

image of 1976 P. Harrigan

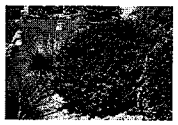

image of 1976 P. Harrigan

The range of Thuja plicata consists of a Coast Range--Cascade Range segment from southeastern Alaska to northwestern California (between 56° 30' and 40° 30' N latitude) and a Rocky Mountains segment from British Columbia to Idaho and Montana (between 54° 30' and 45° 50' N latitude).

Thuja plicata is an important timber tree. Its soft but extremely durable wood is valued for home construction, production of shakes and shingles, and many other uses. Native Americans of the Northwest Coast used it to build lodges, totem poles, and seagoing canoes. Many cultivars are grown for ornament, and the species is managed for timber in Europe and New Zealand.

Western redcedar (Thuja plicata) is the provincial tree of British Columbia.

Thujopsis dolabrata Cupressaceae !

INFO
Common Name: hiba tree
Perennial Tree
Native Range: Japan
Synonomy: Thuja dolabrata Thunberg ex Linnaeus f., Suppl. Pl. 420. 1782; Platycladus dolabrata (Thunberg ex Linnaeus f.) Spach; Thujopsis dolabrata var. australis A. Henry.

Description: Evergreen tree to 30 m tall, ca. 0.6 m in diam.; bark reddish brown, peeling off into thin long strips. Shoots much compressed, densely clothed with scaly leaves, 4–6 mm wide in leafy shoots, ca. 3 mm wide in fruiting ones. Leaves scale-like, persistent, decussately opposite, 4–5 mm long on young branches, to 8 mm long on old branches; the facial pair obovate, obtuse, the upper one thickening, glossy dark green, the lower one compressed, with a white stomatiferous patch on both sides of raised green midrib; the lateral pair hatchet-shaped, strong keeled, incurved and apex acute, glossy dark green on upper surface, each with a white stomatiferous patch on lower surface. Flowers April to May, monoecious, solitary, terminal on the last year's shoots. Male strobili cylindric, 5–6 mm long, 4 mm wide, with 6–8 paired scales, each scale with 3 or 4 anthers. Female cones subglobose, with about 4 paired scales, 1.5–2 mm long, 3–4 mm wide, lower 2 pairs of scales with 5 ovules, upper 2 pairs of scales with 1–3 ovules. Cones ripening in October to November, subglobose, brown, ca. 12 mm long and wide; scales woody, much thickened, the middle pairs larger, orbicular-obovate, ca. 8 mm long, 7 mm wide, with a prominently projected boss on upper dorsal side. Seeds elliptic, dark brown, with narrow lateral wings, including wings 4–5 mm long, 2.5–3 mm wide.

Thujopsis dolabrata f. nana Cupressaceae !

INFO
Common Name:
Perennial Shrub [dwarf tree]
Description: Nana is dwarf, with lighter leaves. In general, this is a slow growing, evergreen tree that is related to the Thuja genus. It's habit is conical to cylindrical. Bark is shredding, brown to gray. Leaves are scale-like, glossy, dark green on the top, silvery underneath. This tree bears both dark violet male and blue-gray female cones. This tree is native to forests in Japan, and is a good candidate for woodland gardens.
Record Notes: Name checked with GRIN, 6/1/2007.

Thujopsis dolabrata var. hondae Cupressaceae !

INFO
Common Name:
Perennial
Native Range: Northern Japan
Description: Cones ripening larger, ca. 12 mm long and wide; middle scales suborbicular, ca. 10 mm long and wide, with short projected boss on upper dorsal side.
For the species:
Tree with pendulous lateral branches, the branchlets 4-6 mm. wide; leaves lustrous, deep green above, with a conspicuous white area beneath, the lateral ones obtuse, ascending, flat and semiovate, 4-6 mm. long, the median appressed, broadly obovate; cones 1-1.6 cm. long, dehiscent, the scales 6-10 mm. long, broadly cuneate, with a deltoid, obtuse, spreading mucro below the apex; seeds elliptic, 4-5 mm. long, 3-3.5 mm. wide, with a thickish wing.
For the variety:
Branchlets more dense; cones larger and globose; scales without a prominent mucro.

Thujopsis dolobrata 'Variegata' Cupressaceae !

INFO
Common Name:
Perennial Tree
Description: Monoecious trees to 15 m tall; bark thin, gray or reddish brown, peeling off in long strips; crown pyramidal; branches ascending; branchlets 4-6 mm in diameter, arranged in a plane, flattened, lower side with white powder. Leaves decussate, scalelike, dimorphic along branchlets; lateral leaves boat-shaped, deep green adaxially, ovate-lanceolate, 4-7×1.5-2.2 mm, with a white stomatal band abaxially, apex obtuse, slightly incurved, overlapping margins of facial leaves, which are appressed, broadly obovate. Cones terminal, solitary. Pollen cones cylindric; microsporophylls 12-20. Seed cones 1-1.6 cm diameter, subglobose; cones scales 6-8, flat, woody, usually mucronate below apex, each fertile scale with 3-5 seeds. Seeds ellipsoid, 4-5×3-3.5 mm, with 2 thick, lateral, narrow wings. Cotyledons 2 (Fu et al. 1999).

Variegated scales
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Species name found in Gymnosperm Database; cultivar name found commonly used in trade with internet search, 10/31/2006.

No native range documented for the cultivar 'Variegata' in recent conifer publications.

Thylacospermum caespitosum — Caryophyllaceae X

INFO
Common Name:
Perennial
Native Range: China
Description: Cushions ± semiglobose to nearly mat-forming, glabrous, 30–50 cm in diam. Stems very densely branched, 2–6 cm tall. Leaf blade ovate-lanceolate, 2–4 × ca. 2 mm, rigid, glossy, base joined to sheath, margin ciliate, apex mucronate. Flowers ca. 4 mm in diam. Sepals green, lanceolate, ca. 2.5 × 1 mm, 3-veined, apex obtuse or acuminate. Petals ovate-oblong, margin entire. Disc yellow, orbicular, fleshy. Stamens shorter than sepals. Capsule glossy yellow, globose, 2.5–3 mm. Seed light brown, ca. 1.5 mm. Fl. Jun–Jul, fr. Jul–Aug.

Exposed level or gently sloping stony areas, often in rock crevices; (3600–)4300–6000 m. Gansu, Qinghai, Sichuan, Xinjiang, Xizang [NW India, Kazakhstan, Kyrgyzstan, Nepal, Sikkim].

This is one of the most prominent high-alpine cushion plants.

Thymbra spicata — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 1.75ft.
Flowers Purple
Native Range: Southern Europe - Middle East
Synonomy: Thymbra spicata Pall. ex M. Bieb.
Description: Thymbra spicata L. var. spicata L, family Labiaceae is perennial plant that prefers dry sunny hillsides and high dry meadows. The height of plants varies between 15-40 cm and the plants bear beautiful purple white flowers

The plant is occasionally used as a condiment. One of several ingredients in the herbal mixture, 'Zatar.
The flavour of its essential oils is similar to those of Origanum syriacum, Thymus capitatus and Satureia thymbra. Occasionally used as incense.

The observed cholesterol-reducer, antioxidant and liver protective effects of the DEE and partially of RA extracts of Thymbra spicata which contain mainly carvacrol indicates that these extracts possess some potential medicinal value and explain their ethnomedical use.

Cultivation: Dry sunny hillsides. High dry meadows in Greece.
Suitable for: light (sandy), medium (loamy) and heavy (clay) soils and prefers well-drained soil. Suitable pH: acid, neutral and basic (alkaline) soils. It cannot grow in the shade. It prefers dry or moist soil.

It is hardy to zone 8.

Record Notes: Name checked with The Plant List on 2/4/2014 by Mona Bourell.

Thymus pseudolanuginosus Lamiaceae !

INFO Common Name: wooly thyme
Perennial Herbaceous
Height: 0.25ft. Spread: 0.25-1ft.
Flowers Pink
Description: From Mo Bot Gard:
Woolly thyme is a creeping, woody based perennial which is used as a ground cover. Hairy stems (this is the woolliest of the thymes) give rise to the common name. Stems form a flat mat often no more than 1/2" tall but spreading to 12" wide. Very tiny, elliptic, gray leaves (to 1/8"). Leaves have little if any fragrance and are unsuitable for culinary use. Tiny, tubular, pale pink flowers appear in the leaf axils in summer in a somewhat sparse bloom. Flowers are attractive to bees.

Cultivation: Easily grown in average, dry to medium, well-drained soils in full sun. Tolerates drought and poor soils or somewhat low fertility. Loose, sandy or rocky soils with excellent drainage are best. Dislikes moist to wet soils where it will quickly rot. Cut back stems as necessary to maintain plant appearance or to control growth/spread or limit unsightly woody stem growth. May not be reliably winter hardy throughout USDA Zone 5 where it would benefit from a protected location.

Record Notes: Name checked with Tropicos on 9/10/2013 by Mona Bourell.

Taxon Family Spelling Checked

Thymus vulgaris Lamiaceae !

INFO
Common Name: garden thyme
Perennial Herbaceous
Height: 0.5 - 1ft. Spread: 0.5 - 1ft.
Flowers Purple, lavender
Native Range: Mediterranean
Description: Garden (or common) thyme is a generally upright, woody-based perennial which is primarily grown as a culinary herb in herb gardens. Numerous, somewhat woody stems grow upward to form a foliage mound 6-12" tall. Stems are clothed with tiny, linear to elliptic, pointed, gray-green leaves which are distinctively revolute (leaf margins are rolled under). Leaves are highly aromatic (reaching their peak just before plants flower) and are frequently used fresh or dried as a seasoning in a variety of culinary applications including soups, stews, sauces, meat and fish dishes. Whorls of tiny, tubular, lilac flowers appear on the stem ends in late spring to early summer. Flowers are attractive to bees. Plants are evergreen in mild winters.

Cultivation: Easily grown in average, dry to medium, well-drained soil in full sun. Loose, sandy or rocky soils with excellent drainage are best. Drought tolerant. Dislikes wet soils where it tends to rot. Cut back plants to limit woody growth or to stimulate new growth. Harvest leaves throughout the summer as needed. Plants tend to become overly woody and loose after several years at which point replacement should be considered.

Record Notes: Name checked with The Plant List on 9/10/2013 by Mona Bourell.

Thymus zygis Lamiaceae !

INFO Common Name:
Perennial Herbaceous
Flowers White
Native Range: Spain, Portugal
Description: This rare and pungent thyme originating from Spain and Portugal is a very attractive, delicate plant with small, resinous leaves and upright branching producing small white blooms. It grows into a compact, nicely shaped mound with a very strong scent. Spanish Thyme is a bit more camphorous than German thyme, but still delicious as a culinary spice. It has been used interchangeably with English and German Thyme for medicinal puposes. Thyme is well known as a cough remedy specific for bronchitis, pertussis and general upper respiratory congestion. Used externally, Thyme is both anti-microbial and anti-fungal and can be used for all sorts of skin rashes, minor scrapes and infections. The essential oil extracted from thyme, Thymol, is used extensively in antiseptic mouthwash, as well as other external applications. This sweet plant is perfect for the rockery or sunny edge of the garden. Prefers well drained, sandier soi. Full sun. Very drought tolerant once established. Perennial. To zone 7.
Flw - May June July

Tiarella 'Candy Striper' — Saxifragaceae !

INFO
Common Name: foam flower
Perennial Herbaceous
Height: 1ft.
Flowers Pink, White
Cultivation: Tiarellas prefer woodland conditions: humus-rich, moisture retentive soil and dappled to full shade. If properly sited, they will keep their nice foliage all winter long, shedding it only when the warmer days of spring arrive. Divide them in early spring before flowering or later in the summer if desired.

Record Notes: Cultivar name found used in the trade with internet search, 7/16/2008.

Taxon Family Spelling Checked

Tibouchina semidecandra — Melastomataceae !

INFO Common Name: glory bush
Perennial Shrub
Height: 10-15ft.
Flowers magenta Jun
Native Range: Brazil
Description: a sprawling, evergreen shrub or small ornamental tree native to Brazil and ranges from 10 to 15 feet (20 feet with proper training) in height. It can be trimmed to any size and still put on a vivid, year-long flower display. The dark green, velvety, four to six-inch-long leaves have several prominent longitudinal veins instead of the usual one, and are often edged in red. Large, royal purple blossoms, flaring open to five inches, are held on terminal panicles above the foliage, creating a spectacular sight when in full bloom. Some flowers are open throughout the year but they are especially plentiful from May to January. Princess-Flower is ideal for the mixed shrubbery border or used in small groupings to compound the impact of bloom-time.

Cultivation: Plant in full sun for best color and maximum flowering. They can tolerate the shade but will not thrive.
Plant in most soils with good drainage and a slightly acid mix is even better. Nematodes can affect Tibouchina and over watering can contribute to mushroom root-rot.

Tibouchina can be difficult to establish. After planting, they may seem to lack the will to grow for a season or two, but then suddenly take off. After that, Tibouchina is easy.

Record Notes: Name checked with The Plant List on 5/14/2012 by Mona Bourell.

Tibouchina urvilleana — Melastomataceae !

INFO

Common Name: princessflower
Perennial Shrub/tree
Height: 6-8ft. Spread: 6-8ft.
Flowers Purple
Native Range: Brazil
Description: Very vigorous grower due to octoploidy.
Tibouchina urvilleana (Princess Flower) - Semi-evergreen open shrub that grows 6-8 feet or more tall by as wide - if really happy can reach 15 feet and be used as a small tree. The ribbed leaves are oval and new foliage is covered with velvty red hairs. A spectacular bloomer with its rich royal purple five-petaled 2-3 inch flowers at the ends of the branches in the spring through fall. Plant in light shade and well-drained soil. Water regularly. Hardy to 27° F. Tip prune occasionally to keep compact.

image of 2002 Saxon Holt

Taxon Family Spelling Checked

Tilia paucicostata — Malvaceae !

INFO
Common Name:
Perennial Tree
Native Range: China
Description: Trees 10-15 m tall. Branchlets usually yellow-brown when dry, slender, glabrous; terminal buds minute, glabrous or slightly hairy at tip. Petiole slender, 2-5 cm, glabrous; leaf blade ovate-orbicular or ovate-triangular, (3-)6-10 × 2.5-6 cm, thinly leathery, both surfaces glabrous or abaxially sparsely tomentose in vein axils, lateral veins 5-6 pairs, basal pair usually 1/2 or more as long as blade, veinlets prominent, base truncate or obliquely cordate, rarely rounded, margin serrate or sparsely dentate, apex caudate-acuminate or acuminate. Cymes 3-10-flowered, usually shorter or rarely longer than bract; peduncle adnate with proximal 1/2 bract. Bracts on slender 0.5-2 cm stalk, oblanceolate, 4-6 cm, glabrous. Sepals 4-5 mm, abaxially glabrous, adaxially villous on proximal half. Petals ca. 4 mm, glabrous. Stamens 25-35, in 5 fascicles, glabrous; staminodes 5, linear-oblanceolate, distal 1/2 slightly wider, 1/2 as long as petals. Ovary ovoid, densely stellate puberulent; style glabrous. Fruit obovoid, 6-7 mm, apex usually beaked; exocarp thickly leathery, fragile, indehiscent. Fl. Jun-Aug, fr. Sep-Oct. 2n = 164*.

Leaf blade 6-10 × 3-6 cm, margin serrate.

● Forests; 1300-2400 m. Gansu, Hebei, Henan, Hubei, Hunan, Shaanxi, Sichuan, Yunnan

Taxon Family Spelling Checked

Titanotrichum oldhamii — Gesneriaceae X

INFO Common Name:
Perennial
Native Range: China, Taiwan
Description: Rehmannia oldhamii Hemsley in F. B. Forbes & Hemsley, J. Linn. Soc., Bot. 26: 194. 1889; Matsumuria oldhami (Hemsley) Hemsley.

Rhizomes with fleshy scales. Stems 20-50 cm, pilose, glabrescent. Petiole 0.3-6.5 cm; leaf blade elliptic to ovate, (2.5-) 10-27 X (1.2-)4.5-12.5 cm, appressed puberulent to scabrous, base oblique, attenuate to rounded, margin repand to coarsely double serrate or dentate, apex acute to acuminate. Inflorescences many flowered; rachis pilose; bracts lanceolate to linear, (2-)5 -10 mm. Calyx segments lanceolate to narrowly triangular, 0.7-1.3 cm. Corolla yellow, inside purple spotted from lobes to base, 3-4.5 cm; tube 2.6-3.7 cm; adaxial lip 4.5-6 X ca. 5 mm; abaxial lip 6-8 X ca. 8 mm. Stamens glabrous; filaments 2.2-2.7 cm; staminode ca. 0.5 mm. Pistil 2-3 cm; ovary densely appressed puberulent. Style 1.8-2.8 cm, glabrous; adaxial stigma 0.4-0.8 mm, abaxial ca. 1.2 mm. Capsule 6-8 X 3-5.5 mm. Fl. Jul-Nov.

Shaded areas in valleys; 100-1200 m. Fujian, Taiwan [Japan (including Ryukyu Islands)].

Titanotrichum oldhamii, with its truly racemose inflorescence, scaly rhizomes, and appendiculate seeds, is distinct within the Gesneriaceae. Its relationship with other genera and its systematic position within the family are unclear.

Taxon Family Spelling Checked

Tithonia diversifolia Asteraceae !

INFO
Common Name: tree marigold, shrub sunflower, Mexican sunflower
Perennial Shrub
Height: 12-18ft. Spread: 15ft.
Flowers Yellow Winter - Spring
Native Range: Meso-America
Potentially Invasive
Description: a rangy shrub with wide and pithy, unbranched ascending stems four to six meters tall, mostly leafless in the lower zone. Leaf arrangement is helically alternate. The typical leaf is fifteen to thirty centimeters long and has a minute roughness (scabridity) on the upper surface. The whitish petiole (acuminate) is fringed halfway with blade tissue, at the terminus of which three whitish midveins vascularize a mitten-like blade with three or five prominent lobes. Occasionally, new shoots possess unlobed leaves.
Stout shrubby herb or shrub 2-3 m tall; stoloniferous; leaves mostly subovate, acute, serrate, 10-40 cm long, long (2-10 cm) petiolate, simple or mostly 3-7-lobed with acute serrate lobes, somewhat glandular, slightly grayish beneath, puberulent on both surfaces; petiole slightly bilobed at base; peduncles 10-30 cm long; heads large and showy, 5-15 cm wide; involucre of bracts in 4 series; ray-florets about 12-15, with yellow ligules to 6 cm long; achenes cuneate, 4-angled, appressed-puberulent, 5 mm long, 2-awned" (Stone, 1970).
Appearance similar to sunflowers, but the thickened peduncle and the persistent pappus distinguish Tithonia. Native to Mexico and Central America, naturilized in tropics.
Cultivation: Average Water Needs; Water regularly; do not overwater
Propagation: by cuttings
Record Notes: Name checked with The Plant List on 2/14/2012 by Mona Bourell.

12/16/2008 Mona Bourell: Mario Veliz [Guatemala] determined this plant in 50F to be T. longiradiata. Formerly in record as T. diversifolia.

10/10/2006 Mona Bourell: Gardener Beat 9 reports this plant established in bed 50F, requests tag and sign, stating that Taylor updated determination to be T. longiradiata. Wait on tag/sign?

12/9/2005 Tony Morosco: Reported by researcher Taylor Neal-Quedensley that this plant is Tithonia longiradiata. Not updating name until confirmed. Try contacting John Strother at UC Berkeley for confirmation.

6/2/2004 Tony Morosco: Plant transfered from Don Mahoney to Pat/Tony. Apparently vegetatively propagated from unaccessioned material planted in Dry Mexico garden in 1999, and kept alive by Plant Sale volunteers. Lore is that the original plant died from Phytopthera rot.

Taxon Family Spelling Checked

Tithonia sp. Asteraceae !

Taxon Family Spelling Checked

Todea barbara — Osmundaceae !

INFO
Common Name: King Fern
Perennial Herbaceous
Native Range: Australia, New Zealand, South Africa
Description: Todea barbara is a large, thick-set fern that resembles a tree fern. The fronds grow from a massive trunk, locally up to a metre or more tall. The fronds emerge from multiple crowns. In our region the fern is quite rare, growing in the darker parts of protected mountain gullies. When you approach one of these in the Bush, the first thing you notice is the large size and the dark green glossy foliage. Closer inspection reveals simpler fronds than other tree ferns. It reputedly makes a good tub fern, though one that requires plenty of room! It is available from plant nurseries. A dozen or more splendid specimens growing in the Blue Range, A.C.T., appear to have been destroyed in forestry operations in the early 1980s.
Record Notes: Name checked with The Plant List on 7/21/2014 by Mona Bourell.

Tolmiea menziesii — Saxifragaceae !

INFO
Common Name: piggy back plant, youth on age
Perennial Herbaceous
Height: 1.5ft. Spread: 1.5ft.
Native Range: Calif - Alaska
Synonomy: Tiarella menziesii
Description: Plant ± hairy, glandular; rhizome scaly; bulblets 0
Leaves basal and cauline, 8–40 cm, reduced upward; stipules 3–8 mm, elliptic, leaf-like, with irregular teeth and short bristles; blade 3–10 cm wide, ovate, base generally cordate, sometimes bearing plantlets, lobes shallow, teeth sharp
Inflorescence: raceme, 10–80 cm; bracts scale-like
Flower bilateral; hypanthium free of ovary; calyx cleft between lower 2 lobes, upper 3 larger; petals 4, 8–12 mm, thread-like, brown-purple; stamens 3, opposite upper 3 sepals; pistil 1, ovary superior, chamber 1, placentas 2, parietal
Fruit: capsule, opening by 2 equal valves
Seed spiny
Chromosomes: 2n=28
Ecology: Moist banks, cliffs
Elevation: < 1800 m.
Bioregional distribution: Northwestern California, n Central Coast, San Francisco Bay Area
Cultivation: Keep the soil evenly moist and fertilize regularly. Likes humidity and good drainage.

Propagation: Plantlets, leaf cuttings
Record Notes: Name checked with The Plant List on 10/11/2012 by Mona Bourell.

Chevalier; T. sinensis var. incarvillei A. Chevalier; T. sinensis var. schensiana (C. Candolle) H. Li ex X. M. Chen.

Description: Trees to 40 m tall; trunk to 20 m tall, to 1.5 m d.b.h., buttressed. Bark gray to dark brown, fissured; inner bark pink to red, fibrous; sap-wood cream-colored to red, fibrous, smelling strongly of garlic and pepper when cut. Leaves 32-120 cm; petiole 5.5-20 cm, glabrous or pilose; rachis often reddish, glabrous or pilose; leaflets usually 8-20 pairs; petiolules 3-9 mm, glabrescent; leaflet blades narrowly lanceolate to linear-lanceolate, 11-22 × 3-5.6 cm, glabrous or pilose especially on midvein and secondary veins, with club-shaped glandular trichomes conspicuous on adaxial midvein areas and junction between leaf rachis and petiolules, base asymmetric, margin serrate, serrulate, or rarely entire, apex acuminate. Inflorescences to 1 m, pendent; rachis pilose, villous, or glabrescent, with short appressed or spreading simple trichomes. Flowers 3.5 -4.5 mm. Pedicel ca. 0.5 mm, pilose to glabrescent. Calyx cup-shaped, 1-1.5 mm, outside glabrous; sepals 0.5-1.1 × 0.6-1.8 mm, margins ciliate. Petals white or flushed pink, 2.8-4.2 × 1.1-2.9 mm, outside glabrous, margin not ciliate. Androgynophore 2.5-4 mm, glabrous; staminodes always present, (1-)5, 0.7-1.8 mm, glabrous; filaments 1.3-1.8 mm (male flowers), 1-1.5

Taxon Family Spelling Checked

Torreya californica Taxaceae !

INFO
Common Name: California nutmeg
Perennial Tree
Native Range: California
Synonomy: Torreya myristica Hooker; Tumion californicum (Torrey) Greene

Description: Trees to 20(--25) m; trunk to 9(--12) dm diam.; crown conic or, in age, round-topped. Branches spreading to slightly drooping; 2-year-old branches reddish brown. Leaves 3--8 cm, abaxial side with 2 deeply impressed, glaucous bands of stomates, flattened on adaxial side, emitting pungent odor when crushed. Pollen cones whitish. Seed (including aril) 2.5--3.5 cm; aril light green streaked with purple. 2 n = 16.

Rare and local along mountain streams, protected slopes, creek bottoms, and moist canyons of the Coastal Range and Sierra Nevada; 0--2000 m; Calif.

Record Notes: Name checked with The Plant List on 10/10/2012 by Mona Bourell.

5gal

Notes

6/3/2009 Olivier Thériault — One plant found during nursery inventory. Accession re-instated.

5/28/2008 Mona Bourell — Terry reports that all 4 in 0A3 were deaccessioned 1/3/2008.

3/18/2008 Mona Bourell — Jeanne reports giving one to SFBG, qty in 0A3 reduced from5 to 4, 3/13/2008

8/2/2007 Mona Bourell — Jeanne & Mona found 5 in 0A3 during inventory, 7/19/2007.

10/4/2006 Tony Morosco — Two plants found in bed 0A3 with tags reading "Torrey ~~californica~~ jackii 01 -0028". Believe these to be erroneously marked T. jackii by misinformed person, and reassigned unambiguously to 2001-0028 Torreya californica. Now a total of 5 plants in 0A3 for 2001-0028.

10/4/2006 Tony Morosco — Three plants that are certain to be the basis of the grafted T. jackii accession 2006-0567 examined in nursery. All found to have been grafted, and the scion died. Quantity and location match with Tony Morosco's memory of seeing them in the nursery. Since the rootstock is still thriving, we decided to keep them, and reactivate them under their existing accession number.

8/11/2004 Tony Morosco — 3 plants in nursery have been grafted with a long-needled Chinese variety-Torreya jackii. See Don Mahoney for details. May need to accession these seperately.

Torreya grandis

Taxaceae !

INFO

Common Name:
Perennial Tree
Native Range: China
Description: Trees to 25 m tall; trunk to 0.5(-2) m d.b.h.; bark light yellowish gray, dark gray, or grayish brown, with irregular vertical fissures. Leafy branchlets oblong-obovate in outline, 4-7 × 2.5-4 cm, axis green and glabrous in 1st year, thereafter yellowish green, light brownish yellow or pale brown. Leaves borne at (50-)60 -90° to branchlet axis; petiole 0.5-1 mm; blade bright green and glossy adaxially, linear-lanceolate, usually straight, (0.7-)1.1-2.5(-4.5) cm × 2-3.5 mm, with no conspicuous grooves, midvein indistinct adaxially, (0.2-) 0.5-0.7 mm wide abaxially, stomatal bands (0.2-)0.3-0.4 mm wide, marginal bands 0.5-0.7 mm wide, base obtuse or broadly rounded, ± symmetric, margin flat or very narrowly revolute, apex symmetrically or slightly asymmetrically tapered, cuspidate, cusp 0.3-1 mm. Pollen cones columnar, ca. 8 mm; bracts conspicuously ridged. Aril pale purplish brown and white powdery when ripe, apex obtuse-rounded or rounded and cuspidatae. Seed ellipsoid to ovoid, elongate-ellipsoid, obovoid, or obovoid-conical, 2-4.5 × 1.2-2.5 cm; female gametophyte tissue slightly wrinkled, not ruminate. Pollination Apr, seed maturity Sep-Nov of 2nd year.

Native habitat: Mountains, open valleys, often by streams, on yellow, red, and dark soils; 200-1400 m. S Anhui, N Fujian, NE Guizhou, W Hunan, S Jiangsu, N Jiangxi, Zhejiang

The wood is used in constructing buildings, bridges, and furniture. The seed, known as "xiangfei," is edible and also yields an edible oil; the essential oil "torreya oil" is extracted from the aril.

Numerous variants have been recognized at the rank of variety, form, or cultivar (cf. S. Y. Hu, Taiwania 10: 23 -25. 1964). Torreya grandis var. sargentii Hu appears very distinct, leaf blade: midvein very narrow, ca. 0.2 mm wide, with green belt on either side ca. 0.3 mm wide, stomatal bands very narrow, 0.2-0.25 mm wide; seed strongly obovoid, 40-45 × 18-20 mm); however, very few specimens have been seen, so the distinctions are probably not genuine; it is included here in the synonymy of var. grandis.

Taxon Family Spelling Checked

Torreya jackii

Taxaceae !

INFO

Common Name:
Perennial Tree
Native Range: China: in N Fujian, NE Jiangxi S Zhejiang provinces
Description: Trees to 12 m tall; trunk to 20 cm d.b.h.; bark gray or dark gray, falling off in thick flakes exposing pale brown cortex. Leafy branchlets horizontal or pendulous, rhombic-elliptic, ± flabellate or broadly obovate in outline, 7-9 × 5-10 cm, axis green turning greenish brown in 1st year, thereafter reddish brown and glossy. Leaves borne at 20-60° to branchlet axis, adjacent leaves (especially distal ones), with blades twisted through ca. 90° so that their surfaces nest within each other; petiole 1-2 mm, twisted; blade deep shining green adaxially, linear to linear-lanceolate, very gradually tapered from proximal 1/3 into apex, distally ± falcate, (2.5-)3-7(-9) cm × (2.5-)3-3.8(-4) mm, leathery, with 2 raised ridges extending from base to near apex, midvein extremely indistinct adaxially, strongly raised abaxially with a flat band on either side, whole midvein band ca. 1.2 mm wide, stomatal bands with silver-gray powder initially but finally brown, 0.1-0.2 mm wide, ca. 12 rows, marginal bands 0.5-0.7 mm wide, base cuneate, slightly asymmetric, strongly twisted, margin thickened abaxially and slightly downcurved but not revolute, apex cuspidate, cusp slender, tapered, 1-1.5 mm, often breaking off. Aril white powdery, with small mucro. Seed obovoid, 2-3 × ca. 1.2 cm; female gametophyte tissue deeply ruminate within. Seed maturity autumn.
Woods; 400-1000 m. N Fujian, NE Jiangxi, S Zhejiang.
The wood is very fragrant, and is used to make agricultural implements, utensils, and handicrafts. The leaves are also very aromatic when bruised or burned, giving off a fragrance like sandalwood oil.
Record Notes: Name checked with The Plant List on 7/9/2014 by Mona Bourell.

ACCESSION

SFBG# 2006-0567 RARE DEACCESSIONED Rec'd: 8/2/2002

Source: International Dendrological Society via Scot Medbury
Orig. Qty: 3
Material: scion

Notes

10/4/2006 Tony Morosco — Three plants that are certain to be the basis of this accession examined in nursery. All found to have been grafted, and the scion died. Quantity and location match with Tony Morosco's memory of seeing them in the nursery. Since the rootstock is still thriving, we decided to keep them, and reactivate them under their existing accession number 2001-0028, Torreya californica.

10/4/2006 Tony Morosco — Rootstock used for these grafted plants came from 2001-0028, Torreya californica. Since plants are grafted, material recieved must have been scions (updated that info). Third plant noted in record for 2001-0028 is missing-perhaps still in nursery, perhaps dead.

9/28/2006 Mona Bourell — Accessioned from label when Jeanne & Mona found 2 in 0A3 during inventory, 9/28/2006. All other accessions from International Dendrological Society were received in 1986 or 1989. Plants are dioecious, one plant is marked male 6227.

Torreya nucifera

Taxaceae !

INFO

Common Name: Japanese torreya
Perennial Tree
Native Range: Japan
Description: Evergreen dioecious tree to 25 m tall, 2 m in diam.; bark grayish brown, shallowly fissured, peeling off into thin long flakes. Branches dull brown, with short woody bases of petioles. Branchlets green, glabrous, running longitudinal stripes from the leaf base. Leaves alternate, pectinate; petiole short, 0.5--1 mm long; blade linear, apex with stiff pungent spins, base obtuse, 15--25 mm long, 2.5--3.5 mm wide, slightly convexed and lustrous dark green on upper surface, with two narrow whitish stomatiferous bands running a long both sides of a raised green midrib. Flowers April to May, in axils on the last year's shoots. Male strobili solitary on short pedicels clothed with several scales, ellipsoid, greenish yellow, 7--9 mm long, 4 mm wide, with numerous spirally arranged scale-like stamens. Female flowers two in leaf-axils on upper parts of shoots, sessile, each flower with one ovule enclosed with 6--8 membranous ovate scales, green, ovule orthotropous, enclothed all over by thick aril. Fruits ripening in October, drupaceous, ellipsoid, green, 20--30 mm long, 15--20 mm wide, with one seed enclothed all over by one layer of thick aril. Seeds ellipsoid, apex acute, 15--25 mm long, 10--15 mm wide.

Taxon Family Spelling Checked

Toxicodendron diversilobum Anacardiaceae !

INFO
Common Name: poison oak, Pacific poison oak
Perennial Shrub
Height: 3-20ft. Spread: 3-20ft.
Flowers White Spring
Native Range: Western North America
Not Invasive
Description: Poison oak has blunt-tipped leaflets, hairy on both sides, that cluster in three leaflets per leaf stem. They are somewhat shorter (3 to 7 cm) than those of poison ivy. The plant commonly appears as either an unsupported, erect bush or a vine, and the center leaf of the cluster resembles an oak leaf. Western poison oak grows along the Pacific Coast from New Mexico to Canada, in low places, thickets and wooded slopes. Leaves generally bright, shiny green above, paler below. Fruits are small whitish berries.

image of © Lee Boerger SFBG

Toxicodendrol, a phenolic oily resin, is present in all the poisonous species and contains a complex active principle, urushiol. Urushiol is distributed widely in the roots, stems, leaves, and fruit of the plant, but not in the flowers, pollen, or epidermis. Contact with the intact epidermis of the plant is harmless; dermatitis occurs only after contact with an injured plant or its sap. However, the epidermis of these plants is very fragile, and relatively minor friction or force such as high winds will injure the plant. The oleoresin may then collect on the surface as a black sticky sap. Dead and dried plants may be dangerous as well because their leaves and vines are also easily damaged. Because neither toxicodendrol nor urushiol is volatile, the dermatitis cannot be contracted through the air unless the plants are burned. Smoke from burning plants carries a substantial amount of the irritating oleoresin and may cause serious external and systemic reactions in susceptible individuals. Inhalation may produce severe trauma to the oral and nasal mucosa and lung tissue.

ACCESSION **SFBG# XY-2571** Rec'd: 1/1/1950
Source: Unknown

Trachelium caeruleum 'Hamer Pandora' Campanulaceae !

INFO
Common Name: Blue Lace Flower
Perennial Herbaceous
Description: Was bred by commercial cut flower growers for its gorgeous, lightly scented, dark purple, lacy, dense & full flower heads up to 6" across. Blooming all summer to fall, this is an extremely valuable garden plant, wonderful in a corner or mid to back of border. Rich, shiny, dark purple tingled foliage is densely borne making a compact bush up to 3' tall by 3' wide! It loves part shade (to full sun by the coast) and loamy soil. SNAIL PROOF!
Record Notes: Species name checked with IPNI, GRIN; cultivar name found used in the trade with internet search, 4/15/2008.

Taxon Family Spelling Checked

Trachelospermum asiaticum Apocynaceae !

INFO
Common Name: yellow star jasmine
Perennial Vine/Liana
Native Range: Tibet, China, Taiwan, India, Japan, Korea, Thailand
Description: Lianas woody, to 10 m, glabrous or pubescent when young. Petiole 2-10 mm; leaf blade elliptic, narrowly ovate, or subobovate, 2-10 X 1-5 cm, membranous to papery, base acute or broadly cuneate, apex obtuse to acute, rarely caudate; lateral veins 6-10 pairs. Cymes terminal and axillary. Sepals appressed to corolla tube, 1.5-3 mm, puberulent to glabrous outside, apex obtuse to subacute; basal glands 10. Corolla white, tube 6-10 mm, dilated at throat, glabrous or puberulent inside facing stamens; lobes obovate, as long as tube. Stamens inserted at or near corolla throat; anther apex exserted or slightly so; disc scales shorter than to as long as ovary. Ovary glabrous. Follicles linear, 10-30 cm X 3-5 mm. Seeds oblong, 2-2.5 cm, coma to 3.5 cm. Fl. Apr-Jul, fr. Aug-Nov. 2n = 20.
Native habitat: Dense or open montane forests, brushwoods, often clinging to trees; 100-1000 m. Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, Jiangxi, Sichuan, Taiwan, Xizang, Yunnan [India, Japan, Korea, Thailand].

Cultivation: They are moderately frost hardy and grow in full sun to full shade.
Record Notes: Name checked with The Plant List on 12/12/2011 by Mona Bourell.
Spelling checked with IPNI, 12/12/2007.

Trachelospermum asiaticum 'Nagaba' Apocynaceae !

INFO
Common Name:
Perennial Groundcover
Description: The forms and colors of Asiatic jessamine are simply beautiful. Asiatic jessamine is a widely grown evergreen ground cover, especially prominent in Zone 8 and warmer landscapes of the southeastern United States. Despite the popularity of this plant, relatively few cultivars exist in the trade. 'Nagaba' is a new cultivar with green leaves and a thin variegated margin. Grow this as a ground cover or in baskets for foliage interest. Asiatic jessamine is shy to flower (compared to Confederate jessamine, (Trachelospermum jasminoides)), and as such, you are less likely to have plants produce the sweet-scented flowers typical of this genus.
Cultivation: Protect these plants through this winter and plant out in the spring.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 12/14/2011 by Mona Bourell. Cultivar name found used in the trade with Internet search.

10/19/2004 Geoff Smick: Plant encountered during inventory of 0G4. Tag seems to read Trachelospermum ogon-nishiki, but I could not locate any information verifying the existence of that species/cultivar. Change name if necessary when ID determined.

Trachelospermum jasminoides Apocynaceae !

INFO
Common Name: confederate jasmine
Perennial Vine/Liana
Native Range: China
RARE or ENDANGERED in native range
Synonomy: Rhynchospermum jasminoides
Description: Lianas woody, to 10 m. Stem brownish, lenticellate; young branchlets pubescent, glabrous when older. Petiole 3-12 mm long; leaf blade ovate to obovate or narrowly elliptic, 2-10 X 1-4.5 cm, papery, glabrous or sometimes sparsely pubescent abaxially. Cymes paniculate, terminal and axillary; peduncle 2-6 cm, puberulent to glabrous. Sepals narrowly oblong, 2-5 mm, spreading or reflexed, pubescent outside, ciliate, apex obtuse or acute. Corolla white, tube dilated at middle, 5-10 mm, throat glabrous or pilose facing stamens; lobes obovate, as long as tube. Stamens included, inserted at middle of corolla tube; ovary glabrous. Follicles linear, 10-25 cm X 3-10 mm. Seeds oblong, 1.5-2 cm, coma 1.5-4 cm. Fl. Mar-Aug, fr. Jun-Dec. 2n = 20.

Trachycarpus fortunei Arecaceae !

INFO
Common Name: Windmill Palm
Perennial Palm
Height: 25-50ft. Spread: 8-10ft.
Flowers Yellow Apr
Native Range: Bhutan, India, Myanmar, Nepal, Vietnam, China
Synonymy: Chamaerops fortunei Hooker, Bot. Mag. 86: t. 5221. 1860; C. excelsa Thunberg; Trachycarpus caespitosus Beccari; T. wagnerianus Beccari.

image of 1978 G. Courtwright

Description: Stem solitary, to 12 m tall, to 15 cm in diam. Leaf sheath fibers persistent, forming an ocrea more than 25 cm; petioles to 60 m, margins with very fine teeth; blades semicircular in outline, to 1.2 m wide, green on abaxial surface, divided to ca. 3/4 their length into 40-50 stiff segments, transverse veinlets barely visible; middle segments to 3 cm wide. Inflorescences 0.7-0.9 m, erect; male inflorescences branched to 4 orders; rachillae 1-3 cm; female inflorescences branched to 3 orders; rachillae 3-15 cm. Fruits black with a waxy bloom, kidney-shaped, to 0.9 × 1.4 cm.

Commonly cultivated, rarely found in forests; 100-2400 m. S of Qin Ling and Chang Jiang [Bhutan, India, Myanmar, Nepal, Vietnam].

Fibers are collected from the leaf bases and made into coats and other items (brooms, brushes, doormats); wax is collected from the fruits; and a hemostatic drug is extracted from the seeds. This species is widely cultivated as an ornamental, especially in cooler climates.

The trunk fibres produced by the leaf sheaths of Trachycarpus fortunei are harvested in China and elsewhere to make coarse but very strong rope, brooms and brushes. This use gives rise to the old alternative name "Hemp-palm". The fibrous leaf sheaths are also frequently used to clothe stems of artificial palms.
Cultivation: Part shade to full sun; moderate water. Salt tolerance
Record Notes: Name checked with The Plant List, 4/4/2011.

Trachycarpus martianus — Arecaceae !

INFO

Common Name: Khasia hills fan palm
Perennial Palm
Height: 20ft. Spread: 6ft.
Flowers Yellow
Native Range: Himalayas
Synonomy: Trachycarpus khasianus
Description: Palmate leaf, glossy green, bare trunk, skirt of old leaves at the very top.

Fruit: 0.5" long Ovoid

Seed: Ovoid, with a date seed like groove

Different from T. latisectus as the petioles are longer, the leaflet cuts are more even in T. martianus. T. latisectus is shinier in appearance.
Cultivation: Full sun to light shade; medium to high salt tolerance

Regular to abundant water

Min. Temperature, 21 degrees F
Record Notes: Name checked with The Plant List on 8/30/2011 by Mona Bourell.

Taxon Family Spelling Checked

Trachycarpus nanus — Arecaceae X

INFO
Common Name: Yunnan dwarf palm
Perennial Palm
Height: 3ft. Spread: 3ft.
Native Range: China: Yunnan
Description: Stem solitary, short and subterranean, to 5 cm in diam. Leaf sheaths not known; petioles 12-25 cm, margins with very small teeth; blades semicircular in outline, ca. 0.5 m wide, green or grayish on abaxial surface, divided to more than 2/3 their length into 20-30 stiff segments, transverse veinlets barely visible; middle segments ca. 2 cm wide. Inflorescences to 0.5 m, erect; male inflorescences branched to 2 or more orders; rachillae ca. 10 cm; female inflorescences branched to 2 or more orders; rachillae ca. 10 cm. Fruits yellowish to brown, with a thin waxy bloom, kidney-shaped, to 0.9 × 1.3 cm.
Native habitat: Dry forests or open areas on mountains; 1800-2300 m. Yunnan.

Brushes are made from bundles of the leaves.

Cultivation: Grows to 6500', cold hardy
Record Notes: Name checked with The Plant List on 9/19/2012 by Mona Bourell.
Originally in record misspelled as T. nanas.

Trachycarpus oreophilus — Arecaceae !

INFO
Common Name:
Perennial Palm
Native Range: Thailand
Description: A recently described (see "Principes" Vol. 41, No. 4) rare species from a single mountain range in northern Thailand, where it grows on exposed ridgetops and spectacular limestone cliffs at over 2000m a.s.l. and is regularly obscured by clouds and buffeted by wind. It has a bare trunk and an attractive small and compact crown of regularly split fan-shaped leaves. Being quite unlike any other Trachycarpus , it will be an envied addition to the temperate or subtropical garden. Any plants larger than seedling size are as yet unknown in cultivation.

2400 m

Grows on Doi Chiang Dao, a peak near Chiang Mai. More of a cloud forest habitat with lots of epiphytes

Taxon Family Spelling Checked

Trachycarpus princeps — Arecaceae !

INFO
Common Name: stone gate palm
Biennial Palm
Height: 21ft.
Native Range: China: Yunnan
Description: A medium sized, solitary fan palm, to about 7m tall, and the trunk up to 20cm across, with large rounded leaves, up to 60 leaflets, and a white, waxy underside to the leaves, even on seedlings.
Said to be the most attractive of the Trachycarpus, but very rarely seen in cultivation because its seeds are so hard to obtain.
Found only in a couple of small, isolated areas of western China, in the extreme north-west of Yunnan, which is nearly at the meeting place of the borders of China, Tibet and Burma. It grows on sheer limestone cliff faces overlooking the the Nu Jiang river (or "Angry River", previously known as the Salween River), which has its headwaters in the Himalayas and finishes in the Gulf of Martaban in Burma.

Cultivation: Cold hardy to 8-10 deg.F
Sunny, moist, but well drained position. Probably quite cold tolerant.

Propagation: Seed might need scarification (cold treatment) before it will germinate.
Record Notes: Name checked with The Plant List on 2/1/2012 by Mona Bourell.

Trachycarpus takil

Arecaceae !

INFO

Common Name:
Perennial Palm
Native Range: India: Mt.Takil
Description: 2500 m

360 degree leaf
tomentosum on base of petiole
From pacsoa.com:
Coming as it does from cool, moist oak forests in the Himalayas in Kumaon, northern India, to 2400m a.s.l., where the winters are bitterly cold and snow is common, this species is the hardiest of all Trachycarpus . In appearance, it is similar to T. fortunei but taller, more vigorous and larger in all its parts. Also, its fibres are thinner and shed readily, leaving a naturally bare trunk. Unfortunately there is still much confusion about the identity of this palm, as one of its relatives, T. wagnerianus , a species which is not known in the wild, with small, very stiff leaves, is commonly referred to as T. takil . The two have no connection. This is the "True Takil". Americans please note !!!
Cultivation: Other genera in the forest there include Betula, Cupressus, Rhododendron, Abies, Rubus, Deutzia, Viburnum, Androsace, and other typically "temperate" taxa
Record Notes: Name checked with The Plant List on 9/27/2011 by Mona Bourell.

Trachycarpus ukhrulensis

Arecaceae !

INFO

Common Name: saramati palm
Perennial Palm
Height: 50ft.
Native Range: Assam-Myanmar
Synonomy: Trachycarpus sp. (Manipur) Trachycarpus sp. (Naga Hills)
Description: The quantity of the leaves available on this palm is 24-28 and the linear segment of each leaf is count to 68-71. Keeping the leaves straight, its horizontal measurement from one point of the linear segment to the other point is 3-1/2ft. The length of the stem is 2-1/2ft. and its bottom breadth measuring from its growing area is 2-1/2 inches and the upper breadth from where the leaves starts growing is 1 inch moreover the stem is covered with small thrones which is unharmful. The downside portion of the leave is fully powdery white and its upside is fully green.

This exciting new Trachycarpus species was recently discovered growing at high altitudes on the Himalayan arch near to the border with Burma boundary in Manipur and Nagaland, India.
There is at least 7 distinct populations , growing in a remote area where access is almost impossible for westerners.
Also known as Trachycarpus sp. Manipur and Trachycarpus sp. ukrhulensis, it grows to heights of up to15 metre tall and with a straight, bare trunk.
It is closely related to Trachycarpus princeps , Trachycarpus takil and Trachycarpus oreophilus. As a young plant it displays an extreme creeping habit and has distinctive thick glaucous leaves on elongated petioles. The white backs to the leaves manifests itself as the mature leaves develop.
Extremely frost hardy , larger than Trachycarpus fortunei, and with impressive white undersides to the leaves, it looks set to be one of the best palms for the future.

It is set apart from Trachycarpus princeps in that the leaf is almost 100% orbital with 60 segments, as opposed to T. princeps with around 48 segments and a leaf that is 66% orbital at best. Petioles appear more robust with curious teeth. It seems possible that Trachycarpus "Manipur" or "Naga Hills" will be described as a brand new species in due course.

Trema cannabina — Ulmaceae !

INFO

Common Name:
Perennial Tree
Native Range: China, Malaysia, Australia
Description: Shrubs or small trees to 6 m tall, monoecious. Bark grayish brown, smooth. Branchlets green, brown, or purplish, variously pubescent or glabrescent. Stipules linear-lanceolate, 2-5 mm. Petiole 4-8 mm, slender, variously pubescent; leaf blade yellow-green to brownish green or brown (never blackish) when dry, ovate, ovate-oblong, or rarely lanceolate, 4-9 × 1.5-4 cm, base rounded to ± cordate or rarely broadly cuneate, margin crenate-serrate, apex acuminate to caudate-acuminate; basally 3-veined; secondary veins 2 or 3 on each side of midvein. Male inflorescences usually in proximal leaf axil of branchlets. Female or androgynous inflorescences usually distal. Male flowers: pedicellate, ca. 1 mm in diam.; tepals 5, obovate. Drupes reddish orange when mature, ± compressed, 2-3 mm in diam.; perianth persistent. Fl. Mar-Jun, fr. Sep-Oct.

Native habitat: Sunny moist forests, scrub on sunny slopes, riversides, open places; 100-1100 m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Hunan, S Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Cambodia, India, Indonesia, Japan, Malaysia, Myanmar, Nepal, Philippines, Thailand, Vietnam; Australia, Pacific Islands].

The fiber is used for manufacturing ropes and paper and the seed oil is used for soaps and lubricants

Record Notes: Name checked with The Plant List on 9/26/2012 by Mona Bourell.

Taxon | Family Spelling Checked

Trema orientalis — Ulmaceae !

INFO

Common Name:
Perennial Tree
Native Range: Himalayas to SE Asia
Synonomy: Celtis orientalis Linnaeus
Description: Trees or shrubs, to 20 m tall, d.b.h. to 80 cm. Bark gray, smooth, irregularly fissured on old branchlets. Branchlets grayish brown, pubescent. Stipules linear-lanceolate, 5-9 mm. Petiole 0.8-2 cm, pubescent; leaf blade 10-18(-22) × 5-9(-11) cm, leathery and fragile, abaxially grayish white to grayish green when dry, pubescent, and surface completely hidden by hairs, adaxially green to grayish green when dry, ± scabrous, and usually rugate, base cordate and oblique, margin denticulate, apex acuminate to acute; basally 3-veined; secondary veins 4-6 on each side of midvein. Male inflorescences 1.8-2.5(-3.5) cm, pubescent. Female inflorescences 1-2.5 cm. Male flowers: 1.5-2 mm in diam.; tepals 5. Ovary rudimentary, obovate-conic, ± compressed. Female flowers: pedicellate; tepals 4 or 5, triangular-ovate, 1-1.5 mm. Drupes black when mature, ± globose to ovoid-globose, ± compressed, 3-5 × 2.5-3.5 mm, rugose; perianth persistent. Seed broadly ovoid, ± compressed, 2-5 mm in diam. Fl. Mar-May(-Jun), fr. Jun-Nov.
Native habitats: Moist forests, dry scrub of open slopes; 400-1900 m. Fujian, SW Guangdong, W Guangxi, SW Guizhou, Hainan, Sichuan, Taiwan, Xizang, Yunnan [India, Indonesia, Japan, Malaysia, Myanmar, Nepal, Sikkim, Sri Lanka, Thailand, Vietnam; Australia, Pacific Islands].

Trema polygama, described from Yunnan, differs in having the inflorescences shorter than the adjacent petioles.

Record Notes: Spelling checked in IPNI, Flora of China, 5/12/2010.

Taxon Family Spelling Checked

Trevesia palmata — Araliaceae !

INFO
Common Name: Snowflake Aralia
Perennial Tree
Native Range: N. India to SW China
Description: Trees, evergreen, to 8 m tall. Trunk to ca. 15 cm d.b.h.; branches prickly, farinose stellate pubescent. Leaves simple; petiole often prickly, 30-70(-90) cm; stipules united into a 2-lobed sheath; blade large, 60-90 cm wide, leathery, both surfaces glabrous or with scattered stellate hairs, lateral veins distinct on both surfaces, deeply 5-9-lobed; lobes narrowly ovate-lanceolate, margin serrate, apex acuminate. Inflorescence a panicle of umbels, ca. 45 cm, densely farinose stellate pubescent when young, glabrescent; peduncles 4-17 cm; umbels 4-5 cm in diam., 25-45-flowered; pedicels 1.5-2 cm. Calyx rim 1-2 mm, farinose stellate pubescent. Stamens 7-12. Ovary 7-12-carpellate. Fruit subglobose to compressed-globose, 1 -1.8 cm in diam., smooth or ribbed; styles united, conic, 2-4 mm, stout, persistent. Fl. Oct, fr. May-Jul.

Mixed forests on mountain slopes; 600-2000 m. S Guangxi, Guizhou, S Yunnan [Bangladesh, Cambodia, India, Laos, Nepal, Thailand, Vietnam].

This species is used medicinally and as an ornamental.

Two varieties (Trevesia palmata var. palmata and var. costata, the latter from S Yunnan) have sometimes been distinguished on the basis of minor differences in fruit shape and the presence or absence of ribs on dry fruit, but they do not appear to be worthy of recognition.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native

Triadica sebifera — Euphorbiaceae !

INFO
Common Name: Chines tallow tree
Perennial Tree
Native Range: Asia
Synonymy: Croton macrocarpus; Sapium sebiferum; Carumbium sebiferum
Description: Trees to 15 m tall, monoecious, glabrous; bark dark green, with longitudinal stripes, pale brownish when older; branchlets spreading, lenticellate. Leaves alternate; stipules 1-1.5 mm; petiole 2.5-6 cm, 2-glandular at apex; leaf blade rhomboid, rhomboid-ovate, broadly ovate, or rarely rhomboid-obovate, 3-13 × 3-9 cm, papery, base broadly rounded, truncate, or sometimes shallowly cordate, margin entire, apex acutely acuminate; midrib slightly elevated on both surfaces, lateral veins 6-12. Flowers yellowish green in terminal 3-35 cm racemes, female in lower part, male in upper part or male throughout. Male flowers 10-15 per bract; bracts broadly ovate, 1.5-2 × 1.5-2 mm, basal glands nearly reniform; pedicels slender, 1-4 mm; bracteoles 3, unequal, margins lacerate; calyx cup-shaped, shallowly 3-lobed, lobes obtuse, irregularly serrulate; stamens 2 or 3, exceeding calyx; filaments free, nearly as long as globose anthers. Female flowers 1 per bract, sometimes with several additional male flowers; bracts 3-partite, lobes acuminate, glands as in male; pedicels stout, 2-5 mm; bracteoles as in male flowers; calyx 3-partite, lobes ovate or ovate-lanceolate; ovary ovoid-globose, smooth, 3-celled; styles 3, connate at base; stigma revolute. Infructescences up to 28 cm; capsules subglobose to pyriform-globose, black when mature, 11-13 mm in diam., 3-seeded; cocci deciduous; columella persistent. Seeds oblate, ca. 8 × 6 -7 mm, black, covered with white, waxy aril. Fl. Apr-Aug, fr. Aug-Dec. 2n = 44.

Native habitat: Wilds of the Huang He valley, forests on limestone, widely cultivated; below 100 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hainan, Hubei, Jiangxi, Jiangsu, Shaanxi, Shandong, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, Vietnam; cultivated in Africa, America, Europe, India].

The pressed seeds of Triadica sebifera are a source of fat, used for candles and soap. The bark and the seed oil contain a poisonous alkaloid. Its roots are used as a medicine to detoxify snakebites. The leaves are used in
