Raoulia hookeri — Asteraceae !

INFO
Common Name:
Perennial Groundcover
Flowers White to cream
Native Range: New Zealand
Description: a low, spreading scabweed that forms a mat of fine silver-grey foliage rosettes. It can grow to 60cm wide and is a New Zealand native found the central North Island southwards from sea level to 1800m. It prefers to grow in sandy or gravelly soil and is often found in riverbeds, where its silver-grey colouration makes it hard to see among the similarly coloured stones and pebbles. Minute white to cream flowerheads appear from spring.

Cultivation: It prefers to grow in sandy or gravelly soil and is often found in riverbeds,
Record Notes: Name checked with The Plant List on 4/18/2012 by Mona Bourell.

Taxon Family Spelling Checked

Raoulia lutescens — Asteraceae !

INFO
Common Name: sheep plant
Perennial groundcover
Height: 0.1ft.
Flowers Yellow summer
Native Range: New Zealand
Description: Plants 1-5 cm, with branches rooting, leaves cruciate, dense, broadly ovate, canaliculate, flowerhead discoid, 1mm across.

Cultivation: Plant in gravelly, humous, moist, sunny sit.e.

Propagation: Propagation by seed in spring, barely covered, germ. 1-3 months, 10-16°C
By cuttings in late spring.
Record Notes: Name checked in IPNI, 4/13/2006. M. Bourell.

Notes

Raoulia monroi — Asteraceae !

INFO
Common Name: fan-leaved mat daisy
Perennial Herbaceous
Native Range: New Zealand: South Island: Nelson, Marlborough, Canterbury and Otago.
Description: Small daisy, forming loose, grey mats. Stems prostrate, creeping and rooting, with ascending branchlets. Leaves 2-3mm long, linear-oblong, coated in white hair; growing in one plane, in two rows along the stem. Flower heads small, up to 5mm. Differentiated from other Raoulia species by leaves arranged in one plane, in two rows along the stem.

Taxon | Family Spelling Checked

Raukaua laetevirens — Araliaceae !

INFO
Common Name: sauco del diablo
Perennial Tree
Height: 20ft.
Native Range: Argentina - Chile
Synonomy: Pseudopanax laetevirens
Description: An evergreen tree or that measures up to 6 m tall (20), ash color bark, the leaves are composite, alternate, the petioles are 2-8cm long, thickened at the base, the leaves are digitate, with uneven leaflets, light green glossy in color, leathery, oblong-lanceolate, attenuate at both ends, toothed edges 3-8 long and 1 -1,6 wide, the flowers are hermaphrodite, pedicelate, clustered in 2-5 in inflorescences with many racemes, the flowers are formed by a floral tube 1.5 mm long, the calyx is split in 5 tepals and 5 thick whitish-green ovate-lanceolate sepals, with a mucro 2 mm at the acute apex, 5 stamens with whitish anthers, loculate inferous ovary 3-5, 4-5 styles, the fruit is a brown spherical drupe 5-5.5 mm in diameter, crowned by two styles.

It grows in rainforests and near water courses.

Taxon Family Spelling Checked

Ravenea xerophila Arecaceae !

INFO
Common Name:
Perennial Palm
Native Range: Madagascar
Description: A medium to large palm to about 8m tall, with gracefully arching leaves to about 3m long, with very narrow leaflets. From dry, open forest of south Madagascar. This plant develops a very vigorous root system of fleshy white roots, wher it stores up water for dry times.

Cultivation: Full sun, and very well drained. Does seem to be able to take quite a lot of water, as long as the drainage is good. Quite a slow grower.

Regelia megacephala — Myrtaceae !

INFO
Common Name: Large Regelia
Perennial Shrub
Height: 8-10ft.
Flowers Purple Spring
Native Range: Western Australia
Description: Handsome erect shrub 8-10',with purple flowers in spring. Good speciman plant.
Cultivation: Tolerates heavy frost, full sun or partial shade. Prefers acid to neutral well-drained soils. Prune for bushier growth.

Rehmannia elata Plantaginaceae !

INFO
Common Name:
Perennial Herbaceous
Native Range: China: Hubei
Synonomy: Rehmannia angulata
Description: Herbs, sparsely villous to villous. Stems 1. Petiole 5-6 cm, winged; leaf blade obovate-oblong to elliptic, papery, abaxially sparsely villous along veins, adaxially subglabrous, base cuneate and tapering, margin with 2-6 pairs of lobes and lobes irregularly triangular and entire or toothed, apex obtuse. Flowers including pedicel equal to or shorter than bracts. Pedicel 3-4 cm, villous. Bracteoles absent. Calyx 2-3 cm, villous; lobes 5, unequal. Corolla purple-red, ca. 6 cm; tube inflated, abaxially subsaccate; throat villous; lower lip lobes oblong to suborbicular, 6-10 X 5-10 mm; upper lip lobes transversely oblong, 0.6-1 X 0.8-1.2 cm, subequal. Filaments glabrous. Style slightly longer than stamens. Fl. Jun.

Rehmannia piasezkii Plantaginaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers Purple-red
Native Range: China: Hubei, Shaanxi
Synonomy: Rehmannia angulata (Oliv.) Hemsl., Rehmannia glutinosa var. angulata Oliv.,Rehmannia glutinosa var. piasezkii (Maxim.) Diels

Description: From Flora of China:
Herbs, 30-100 cm tall, villous. Stems simple or branched from base. Petiole ca. 4 cm, decurrent and gradually shorter upward; leaf blade narrowly elliptic, to 15 X 7 cm, white villous, pinnately parted and lobes subtriangular, lobe margin triangularly toothed. Flowers borne above middle of stem. Pedicel 2-4 cm, villous with eglandular and glandular hairs. Bracteoles 2, similar to leaves in shape, sessile, inserted near base of pedicels. Calyx 1.5-3 cm, villous and glandular hairy, unequally 5-lobed; lower lobes ovate-lanceolate, 0.5-1.5 cm; upper lobes lanceolate, ca. 2.3 X 2.3-3 cm. Corolla purple-red, 5-6 cm; tube 3.5-4 cm, somewhat saccate, outside villous or glabrous, inside long glandular villous on plaits, apex extended; lower lip middle lobe obovate-oblong and 1-1.6 X ca. 1 cm, lateral lobes suborbicular and 0.8-1.2 X 1.1-1.2 cm; upper lip lobes transversely oblong, 1-1.1 X 1.1-1.5 cm. Filaments glabrous or sparsely glandular pilose. Stigma unequally 2-lamellate. Fl. May-Sep.
Native habitat: Mountain slopes; 800-1500 m. Hubei, Shaanxi.

Record Notes: Name checked with The Plant List on 3/27/2014 by Mona Bourell. Acc from Chiltern Seed received as R. angulata which is a synonym.

Rehmannia piasezkii 'Popstar' Plantaginaceae !

INFO

Common Name:
Perennial Groundcover
Height: 2ft.
Flowers Raspberry pink
Synonomy: Rehmannia angulata 'Popstar'
Description: Rehmannia 'Popstar' has raspberry-pink flowers with spotted throats. It spreads by underground runners, which makes it a nice groundcover.
Description of Genus:
Herbs, perennial. Rhizomes present. Stems erect, simple or branched from base. Basal leaves rosulate, stem leaves alternate and petiolate; leaf blade varying in shape, often hairy, margin toothed or lobed. Inflorescences sometimes scapose. Flowers axillary and solitary or in terminal racemes, pedicellate. Bracteoles present or absent. Calyx 5(-7)-lobed. Corolla purple-red or yellow, tubular; tube slightly curved or straight, dorsiventrally compressed, with 2 plaits from tube base to throat; limb 2-lipped, 5-lobed. Stamens 4, didynamous, rarely 5 and 1 smaller than other 4, included; anthers coherent in pairs, locules fertile. Ovary base with a disc, 2-loculed, rarely 1-loculed; ovules numerous. Stigma 2-lamellate. Capsule with persistent calyx, loculicidal. Seeds minute; seed coat reticulate.
Six species: endemic to China.

Record Notes: Originally in record as Rehmannia angulata 'Popstar'. Species name checked with The Plant List on 12/21/2011 by Mona Bourell, and found to be a synonym of Rehmannia piasezkii Maxim. Cultivar name found used in the trade with internet search.

Taxon Family Spelling Checked

Rehsonia brachybotrys Fabaceae !

INFO

Common Name: Murasaki-kapitan (Japanese), purple wisteria
Perennial Vine/Liana
Height: 25ft. Spread: 25ft.
Flowers Purple (White) Spring
Native Range: Japan
Synonomy: Basionym: Wisteria brachybotrys Siebold & Zucc.
Description: Often recommended as one of the most strongly scented wisterias it has deep blue-violet flowers with prominent white, slightly yellow-tinged markings. Each raceme of W. brachybotrys Murasaki-kapitan is about 20cm (8in) in length with approximately 35 to 47 individual flowers.
Little is known about how Wisteria brachybotrys Murasaki-kapitan was introduced into cultivation but it is believed to have reached the west when Philipp Franz van Siebold (1796-1866), a German doctor who visited Japan in 1823-1830 and 1859-1863, and introduced it to Ghent in 1830
Cultivation: Wisteria will grow in any fertile, moist, well-drained soil in full sun or partial shade, though they will flower more profusely in full sun. Traditionally wisterias are trained against walls, fences and pergolas but they can also be grown through large deciduous trees where their spring flowers can add interest before the plant's leaves are fully developed.
Given good soil conditions wisterias can establish rapidly but will need training to produce the best flowering display in a limited space, though specimens can be left to naturally grow through large trees where space is less limiting.
Prune initially to form a suitable framework. Once established prune to encourage the formation of flowering spurs, close to the main framework of the plant.
Propagation: Wisterias can be propagated using basal cuttings from sideshoots in early to midsummer; encourage rooting by providing bottom heat. However, cuttings can take up to nine years to flower. Commercially wisterias are grafted so that older material is grafted onto a young rootstock thus producing a flowering plant much more quickly.
Plants can be raised from seed but are very variable, can take up to 20 years to bear flowers, and are usually inferior to named cultivars. Sow seeds in spring at 10

6/24/2004 Tony Morosco	One possibly deaccessioned from nursery bed 0V per S. Medbury. Deleted location record. Accession tag probably still on plant.

Taxon | Family Spelling Checked

Rehsonia brachybotrys 'Shiro Kapitan' — Fabaceae !

INFO
Common Name: Silky Wisteria
Perennial Vine/Liana
Height: 25+ft. Spread: 25+ft.
Flowers White Spring
Native Range: Japan
Synonomy: in nursery trade as Wisteria brachybotrys 'Shiro Kapitan'.
Description: Silky wisteria is a woody, counter clockwise-twining, deciduous vine which typically grows 10-25'. Features bright green, 8-14" long, compound pinnate leaves (each with 9-13 leaflets) which are pubescent (hence the common name) on both sides. Drooping clusters (racemes to 6" long) of fragrant, pea-like, white flowers bloom in May as the leaves emerge. Flowers give way to pendant, velvety, bean-like seed pods (to 8" long) which ripen in autumn and may persist into winter. Excellent vine for large, sturdy, free-standing arbors, pergolas or fences. Can be grown up the side of buildings on large trellises or other structures. May be trained as a specimen shrub or tree.
Cultivation: Though susceptible to a number of foliage-chewing insects and fungal diseases, none are significant. Considered a high maintenance plant, however, because of its need for regular pruning, its invasive tendencies which must be constantly monitored (particularly if grown on structures adjacent to buildings) and its vulnerability to late spring frost damage to flower buds. Best grown in acidic, moderately fertile, medium wet, well-drained soils in full sun. Best flowering in full sun. Needs a sturdy support structure on which to grow. Can be invasive (rampant growth plus rooting surface runners). Needs regular pruning to control size and shape of plant. Can be slow to establish.
Record Notes: Scientific name checked in Flora of China (no longer Wisteria, although called that in Nursery trade). 6/12/2006. Cultivar name spell checked in Google search 6/12/2006.

Reineckea carnea — Asparagaceae !

INFO
Common Name: Chinese Reineckia
Perennial Groundcover
Flowers White, Pink, Purple
Native Range: China, Japan
Description: Stems prostrate, stout, greenish, elongate, with a tuft of leaves at the summit; leaves broadly linear to lanceolate, to narrowly oblanceolate, 10-40 cm. long, 5-20 mm. wide, deep green, glabrous, acute, gradually narrowed below; inflorescence spicate, 3-8 cm. long, densely many-flowered, glabrous, the scapes 8-12 cm. long, the bracts membranous, ovate-deltoid, 4-7 mm. long; flowers pale rose, the perianth 8-12 mm. long, the segments slightly longer than the tube, reflexed, narrowly oblong, obtuse, slightly fleshy; stamens shorter than to as long as the style, the anthers about 2 mm. long.

image of © 2014 Mona Bourell, SFBGXY-2539

Rhizome terete, elongate, 2–4 mm thick, slender. Leaves 3–8, linear, narrowly oblanceolate, or lanceolate, 10–40 × 0.5–3.5 cm, glabrous, apex acuminate. Scape 5–15 cm. Spike 2–6.5 cm; bracts ovate-deltoid, 5–7 mm. Flowers fragrant, sometimes male flowers borne distally on spike. Perianth pink or pale rose, 0.8–1.3 cm; tube 4–6 mm; lobes reflexed, oblong, 5–7 mm, slightly fleshy. Filaments with free part 3–4 mm; anthers suboblong, 2–2.5 mm, emarginate at both ends. Ovary narrowly ovoid, ca. 3 mm. Style 7–10 mm. Berry red at maturity, 6–10 mm in diam. Fl. and fr. Jul–Nov. 2 n = 38*.
Native Habitat: Dense forests, shady and moist slopes, hillsides along valleys; 100–3200 m. Anhui, Guangdong, Guangxi, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Sichuan, Yunnan, Zhejiang [Japan].

Restio festuciformis
Restionaceae !

INFO
Common Name: green grass reed
Perennial Graminoid
Height: 1-1.5ft.
Flowers Brown
Native Range: South Africa
Description: Restio festuciformis (Green Grass Reed) - A very ornamental small restio that forms tufts to only 12 to 18 inches tall with fine textured bright green slightly branching stems that move about even in a gentle breeze. When in flower, typically in late winter to early spring, both the very similar male and female flowering plants have feathering golden brown bracts and stems and leaves that turn a golden green; female plants bear small brown seed head that ripen in summer. New growth flushes from the center and the plant will be more attractive with an annual removal of the previous year's growth. In its native habitat t is widespread in damp areas in the lowlands and the foothills of the mountains of the Western Cape below 2,500 feet where it is noted as being less showy than in cultivation. In the wild it may be longer living and rejuvenated by wild fires while vigorously growing plants in the garden may only live 2 to 4 years before needing replacement. Restio festuciformis looks more grass-like than most restios - hence the name festuciformis meaning "like a fescue".
Cultivation: Plant in full sun to light shade in a well drained soil and irrigate regularly. Hardiness is not well know for this species but it has not suffered at temperatures down to 26° F and is likely a bit hardier.
A great plant for planting in mass and also nice as an accent plant or in a container.
Record Notes: Name checked with African Flowering Plant Database, 2/17/2009.

Taxon Family Spelling Checked

Restio quadratus
RestionaceaE !

INFO
Common Name:
Perennial Graminoid
Height: 6ft. Spread: 5ft.
Native Range: South Africa
Description: Tall reed-like plant with a spreading habit. The mature stems (culms) are thick and square in shape with clusters of sterile branches at the nodes. The young culms look very attractive with dark green, soft and fluffy looking foliage.

The latin species name of quadratus refers to the very distinctive thick, square stem. The common name of 'vlakteriet' refers to the large plains or 'vlaktes' where this species grows in damp localities, often near seeps. Even though most restios adapt very well to a regime with little or no watering during summer, Restio quadratus has to have regular water to look at its best.

This is a plant for large gardens because the plants are not only tall, up to 2 m in height, but can also easily attain a diameter of 1.5 m at ground level. The stems are upright and slightly curved at the top, where most of the clusters of sterile branches are situated. The flowers are small and white but the female plants provide more of a show than most restios, as they flower profusely for a short time. This species is wind pollinated and releases a large quantity of pollen during the flowering period.

Cultivation: This species grows best in a position in full sun, in a well-drained but moist soil and needs plenty of air movement around it. When the plants are grown in light shade they look quite attractive, stay smaller and very feathery and do not produce much seed. The plants adapt to a large variety of soil types.
The best time for planting restios is at the beginning of the rainy season, as the plants need regular watering during the first six weeks to two months after planting. The plants need a normal garden watering regime and are not suitable for dry gardens. They may be fed with standard seaweed-based organic fertilizers, or by sprinkling the surrounding soil with a small amount of ammonium sulfate during the growing season. When the stems are three years old, they start dying down and should be removed at ground level. This is the only

Restio tetraphyllus — Restionaceae !

INFO
Common Name: Tassle Cord Rush
Perennial Graminoid
Height: 3ft.
Flowers Brown
Native Range: Tasmania
Synonymy: basionym of: Baloskion tetraphyllum (Labill.) B.G.Briggs & L.A.S.Johnson
Parentage: Baloskion tetraphyllum (Labill.) B.G.Briggs & L.A.S.Johnson

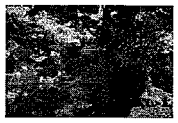

image of 1972 Strybing Arboretum Society

Description: Probably the largest and most conspicuous of the Tasmanian Restionaceae. The stems are much branched, giving a feathery appearance. Common, especially in wet, disturbed areas. Graceful bright green evergreen foliage suitable for cutting 75cm. Needs poor nutrient soils. Maybe the only hardy restio. Tasmania.
Cultivation: Tolerant of Phytophora cinnamomi
Record Notes: Name checked with Tropicos on 11/27/2012 by Mona Bourell. Plant List considers it a synonym of Baloskion tetraphyllum.

Taxon Family Spelling Checked

Retrophyllum minus Podocarpaceae !

INFO
Common Name:
Perennial Tree
Height: 6-9ft.
Native Range: New Caledonia
Description: Small tree or shrub, 2-3 m tall. Bark rough, fissured, fibrous, slightly scaly, exfoliating in short and thick verticals bands or in crumpled pieces, light to deep brown, often colored by iron oxide due to periods of immersion. Leafy branchlets opposite or alternate on leafless branchlets, either isolated or in groups at the distal end of an old leafy branchlet, axils having one or two pairs of spreading scales. Juvenile leaves distichous, equally twisted at the base, not close, lanceolate, the distinct midrib with a large raised surface that on the lower side appears to form three ridges, reaching length of 39×3-4.5 mm, very small on old plants, often close between them, not distichous but always equally twisted. Adult leaves almost imbricate and closely spaced, but some have a slight and regular rotation; coriaceous, the distinct midrib having a large raised surface, much larger than the edges which are not raised, oval, dull, 7-20×2.5-5 mm. Leafless scaly branchlets scattered, spreading, roundish, thick, 1.5-2.5 mm long, much smaller on juvenile specimens. Pollen cone solitary, sometimes in groups of five or more, terminal on a deciduous shoot, oval, 4-8×2-2.5 mm. Microsporophyll triangular with a long apex. Seed cone terminal on a leafy branch, formed by 2-3 pairs of decussate squagiform bracts close between them, followed by 2 unequal bracts of which one is fertile (or seldom 2 fertile equal ones). Micropyle of the ovule inverted, situated on the tip of a dull beak that extends 2 mm below the fertile bract; the fertile scale completely encloses the ovule and forms an apical, asymmetric ridge that persists on the ripe fruit. Seed globular or pear-shaped, about 20 mm long with a curved beak, 11 -12.5 mm in diameter, covered by fleshy, glaucous scales that sometimes become deep red at maturity. Seed surface rough and porous, well adapted to floating (de Laubenfels 1972).

The base of the trunk is bulging like the trunks of Taxodium species. It differs from its congener R. comptonii in the morphology of the flowers, the male cone and the seed (de Laubenfels 1972).

Taxon Family Spelling Checked

Retrophyllum rospigliosii Podocarpaceae !

INFO
Common Name:
Perennial Tree
Height: 90ft.
Native Range: Western Venezuela, East Colombia, Central Peru
Synonomy: Podocarpus rospigliosii; Decussocarpus rospigliosii; Nageia rospigliosii
Description: Trees to 30 m tall and 40 cm dbh, with an oval crown commonly branched from above 3 m. Bark scaly. Leaves light green, 1 cm long, opposite with a whole margin, flattened along the branches, with petioles almost nonexistent. Flowers cream-colored, 1 cm lang, with ovoid green fruits 3 cm long bearing a single seed. A very slow-growing tree (Nieto and Rodriguez 2003).

The wood is easily worked, used for furniture, veneer, moldings, wood shaving boards, boxes, and general cabinetry. It is also used for light poles, paper pulp, and pencils (Nieto and Rodriguez 2003).
Cultivation: The tree needs constant humidity and cloudines, which it finds in habitats that include pre-mountainous wet and very wet forest, low mountainous wet and very wet forest, and mountainous pluvial forest. The tree develops best on gentle slopes, fertile river lowlands, plateaus, and small depressions. It grows in wet, clay or clay-sand, deep, relatively fertile soils with good to slow drainage and acid pH (Nieto and Rodriguez 2003).

Taxon Family Spelling Checked

Rhagodia spinescens — Amaranthaceae !

INFO
Common Name: Australian Saltbush
Perennial Shrub
Height: 2-4ft. Spread: 4-6ft.
Native Range: Central and Eastern Australia
Synonomy: nomenclatural synonym: Rhagodia spinescens var. deltophylla F.Muell.
synonym: Rhagodia deltophylla (F.Muell.) A.J.Scott

Description: A dense gray foliaged plant to 1- 2 feet tall by an 8 foot spread. Gets to 4 feet tall if irrigated or grown in coastal northern California. As with most other saltbushes, it tolerates adverse conditions such as drought, frost and salty seaside conditions. This plant was originally invisioned as a groundcover for Alyogyne huegelii by the folks at UCSC. Unfortunately in cool moist Santa Cruz this plant gets too tall but here is Santa Barbara it has remained low.
Cultivation: Plant in full sun and water sparingly. A great groundcover for a dry sunny sight - will grow up a fence to make a vertical wall. Hardy to low 20 F.
Record Notes: Species name checked with The Plant List; the former family Chenopodiaceae is considered a subfamily [Chenopoodioideae] of Amaranthaceae according to the Angiosperm Phylogeny Website - on 8/23/2011 by Mona Bourell.

Rhamnus californica See: Frangula californica !

Rhamnaceae

INFO
Common Name: Coffeeberry, Coffee Berry, California coffeeberry
Perennial Shrub
Native Range: California - Oregon
Description: Shrub < 5 m
Stem: bark bright gray or brown; twigs glabrous to finely hairy; terminal bud not covered with scales
Leaves evergreen; petiole 3–10 mm; blade 20–80 mm, ovate to elliptic, thick, base acute to rounded, tip acute, rounded, or truncate, margin serrate to entire, sometimes rolled under, both surfaces ± glabrous
Inflorescence 5–60-flowered; pedicels < 20 mm
Flower bisexual; hypanthium 1–2 mm; sepals 5; petals 5; style included
Fruit 10–15 mm, black
Ecology: Coastal-sage scrub, chaparral, woodlands, forests
Elevation: < 2300 m.
Bioregional distribution: Northwestern California, n Sierra Nevada Foothills, Central Western California, Southwestern California, Desert Mountains (Providence Mtns)
Distribution outside California: sw Oregon
Sspp. intergrade in intermediate habitats.
Record Notes: Name checked with The Plant List, Jepson Manual 2012, on 9/4/2014 by Mona Bourell, and found to be a synonym of Frangula californica.

Rhamnus californica 'Ed Holm' Rhamnaceae ?

INFO
Common Name:
Perennial Shrub
Height: 3ft. Spread: 5ft.
Flowers not significant
Native Range: California
Description: Named for a noted local horticulturist, the Ed Holm Coffeeberry is a low growing selection, slowly forming a mound 3-4 feet tall and wide.
Cultivation: Culture is similar to other Coffeberry, with sun to light shade and occasional summer water being ideal.
Sun: Sun-Part Shade
H20: Occ.H2O/moist

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Species name checked with The Plant List on 9/4/2014 by Mona Bourell, and found to be a synonym of Frangula californica subsp. crassifolia (Jeps.) Kartesz & Gandhi . Cultivar name found used in the trade with internet search, 7/19/2011.

Rhamnus cathartica — Rhamnaceae !

INFO
Common Name: purging buckthorn
Perennial Shrub/tree
Native Range: Russia (W Siberia); NW Africa, C and SW Asia, Europe, China: Xinjiang
Description: Shrubs or trees, dioecious, 5-8 m tall, spinose. Young branches glabrous; branchlets opposite or subopposite, purple-red or silvery-gray, terminating in a spine; terminal buds elliptic, with few scales, margin ciliate. Leaves subopposite or alternate, or fascicled on short shoots; petiole 1-2.7 cm, adaxially canaliculate, sparsely hairy or subglabrous; leaf blade elliptic, ovate-elliptic, or ovate, 3-6.5 × 1.5-3 cm, papery, both surfaces glabrous, lateral veins 3 or 4 pairs, proximal pair often slightly stronger than others, base rounded or broadly cuneate, margin densely crenate-serrate, apex shortly acuminate, acute, or rounded-obtuse. Flowers unisexual, 4-merous, usually 10-fascicled on short shoots or in leaf axils of lower part on long shoots. Pedicels 2-4 mm. Male flowers with petals; ovary rudimentary. Female flowers apetalous, with minute rudimentary stamens; ovary 3-loculed; style long, 3-fid. Drupe black, globose, to 1 cm in diam., with 3 stones, with persistent calyx tube at base. Seeds yellow, abaxially with margined furrow extending over 3/4 of length. Fl. May-Jun, fr. Jul-Sep. 2n = 24.
Native habitat:
Thickets, valleys, slopes; 1200-1400 m. N Xinjiang [Russia (W Siberia); NW Africa, C and SW Asia, Europe].

The fruit is used medicinally for treating constipation.

Description: Climbing vine collected in dense shaded broadleaf evergreen forest.

Lianas, medium to large, to 15 m, moderately robust. Stem pale green, terete, 8-12 mm in diam., rooting, internodes 2-5 cm, terete to weakly sulcate on opposite sides, branching usually short but abundant. Leaves tending to cluster at shoot tips; petiole light green, 10-20 cm, shallowly channeled; pulvinus thickened, 8-12 mm; petiolar sheath reaching pulvinus, marcescent; leaf blade oblong, elliptic-oblong, or ovate-oblong to oblong-lanceolate, 8-25 × 4-11 cm, subleathery, base rounded to subtruncate, margin entire, apex abruptly acuminate or acute; primary lateral veins many, parallel, diverging at 45° from midrib. Inflorescences solitary, terminal on lateral free branches; peduncle erect, distally recurved, robust, 8-10 cm; bracts around base early caducous, linear, 6-7 cm, membranous. Spathe gaping and thence spreading at anthesis then caducous, dull orange outside, dull yellow to dull orange inside, elliptic-oblong or oblong in outline, 7-9 cm, apex with rostrum ca. 10 mm. Spadix sessile, ochraceous, pale white, or violet [or yellowish white or yellow], cylindric, 5.5-8 cm, ca. 4/5 of total spathe, 1-1.2 cm in diam. Stamens shorter than ovary during female anthesis; at male anthesis filaments extending to project thecae beyond pistil; anthers elliptic. Ovary tetragonal- or hexagonal-cylindric, ca. 2 × 2 mm; stigma oblong, small. Infructescence initially green, later turning dull orange prior to stylar plates sloughing away, broadly cylindric, 10-13 × ca. 3 cm. Fl. Sep-Oct.

Evergreen forests, valley forests, on trees or on stone walls; 1800-2800 m. Guizhou, Yunnan [Bangladesh, Bhutan, N Cambodia, NE India, Laos, N Myanmar, Nepal, N Thailand, N Vietnam].

The plant is used medicinally for treating fractures, traumatic injuries, rheumatic arthralgia, angina pectoris, bronchitis, and coughs.

Rhapidophyllum hystrix Arecaceae !

INFO
Common Name: needle palm
Perennial Palm
Native Range: SE United States
Synonomy: Chamaerops hystrix Pursh; Sabal hystrix (Pursh) Nuttall; Rhapis caroliniana Hort ex Kunth; Sabal hystrix (Pursh) Nuttall

Description: From FNA:

Stems erect or procumbent, short, 1–7 dm, caespitose shoots often present. Leaves less than 70 cm wide; leaf sheath bearing stout emergent spinelike fibers, ca. 50 cm. Flowers yellowish. Fruits brown, ellipsoid, length ca. 2 cm, diam. 1.5 cm. 2n = 36.
Flowering spring. Rich soil over limestone in shady mesic to wet woodlands, and along banks of ravines and streams; 20–100 m; Ala., Fla., Ga., Miss., S.C.
The palm usually grows prodecumbently with adventitious roots emerging from the trunk where it contacts moist soil (A. G. Shuey and R. P. Wunderlin 1977). In the wild, Rhapidophyllum forms suckers along its stem, and it is thatis vegetative reproduction, more than seedling reproduction, that maintains most populations (K. E. Clancy and M. J. Sullivan 1988).
Flowers are protandrous and most likely to be pollinated by a species of Notolomus (Coleoptera: Curculionidae). The evil-smelling and curiously hirsute fruits are taken by black bears (D. S. Maehr and J. R. Brady 1984) and other mammals (A. G. Shuey and R. P. Wunderlin 1977).

Rhapis excelsa Arecaceae !

INFO
Common Name: lady palm
Perennial Palm
Height: 10ft.
Native Range: China - Vietnam
Synonomy: Chamaerops excelsa Thunb.
Description: Stems clustered, rhizomatous, forming large, loose colonies, to 3 m tall, to 1.5 cm in diam., covered with persistent, fibrous leaf sheaths. Leaf sheaths with coarse, black fibers producing a square mesh; ligules not persistent; blades not split to base, divided into 2-13 segments, these with ± straight sides and jagged apices, to 40 × 7 cm, outermost narrowest. Inflorescences borne among leaves, branched to 2 or 3 orders; bracts tubular, sheathing; rachis to 26 cm; rachillae to 11 cm, glabrous; male flowers to 6 mm; sepals united into a tubular, 3-lobed calyx; petals united into a tubular corolla with a 3-lobed, valvate apex; stamens 6, borne in 2 series; filaments keeled adaxially; female flowers similar to but shorter than male. Fruits developing from 1 carpel, yellow, globose to ellipsoid, to 1 × 0.8 cm.

Scattered localities in lowland forests or dry forests, on slopes; below 1000 m. Fujian, Guangdong, Guizhou, Hainan, Yunnan [Thailand (?introduced), Vietnam].

The stems are used for chopsticks and walking sticks. This species is widely planted as an ornamental and has been introduced in Japan.

Cultivation: Light: Grow in shade to part shade for best leaf color. Plants grown in direct sun tend to fade to yellow green and tip burn in hot weather if not provided adequate moisture.
Moisture: Adaptable to most soils. Maintain adequate moisture for best appearance. This palm can survive periods of drought once established.
Hardiness: USDA Zones 9 - 11. Can survive temperatures down to mid twenties without damage. Lower temperatures will kill stems but plant may recover.
Use lady palm in the landscape to create dense screens and hedges. Thin out stems and trim leaves to make a graceful accent for the patio or Japanese garden. Lady palm can be used for foundation plantings and in outdoor tubs and planters. It is tough enough to handle

Rhapis multifida Arecaceae !

INFO
Common Name: finger palm
Perennial Palm
Height: 8ft. Spread: 8ft.
Native Range: China: Kwangsi
Description: Rhapis multifida is a relative newcomer to the palm collectors. Native to southern China and has a cold hardiness of 28° F and will even tolerate light frost without damage. The suckering trunk is thin with a brown woven fiber on it. The leaves dark green and are an almost full circle palmate with long thin leaflets. The leaf fan has an unusual characteristic in that the center and two outer leaflets are wider than the others. Leaves can also reach up to 24 inches across, but this is usually only in low light conditions. Typically there are about a dozen leaflets to each fan, but some actually have as much as tripled this amount. This can grow to about 6 to 8 feet tall and is a moderate grower given the minimum requirement of rich well drained soil in a moist and shady or filtered sun location. Inflorescence is among the leaves and enclosed in tubular bracts, that are multiple branched. Fruits are rounded to oval, and are about 5/16 inch long. This is suitable for as a patio palm since it does not get too large. Some consider this the ultimate Lady palm due to the fan leaves with its numerous narrow segments and slender canes. This is the most delicate looking of all Rhapis and also makes an extraordinary house plant.

Cultivation: Growth rate: moderate
Sunlight: filtered
Water: medium
Cold Tolerance: 28° F
Record Notes: Name checked with The Plant List on 11/30/2011 by Mona Bourell.

Rhapis robusta Arecaceae !

INFO
Common Name:
Perennial Palm
Height: 6+ft.
Native Range: China: Kwangsi - Vietnam
Description: R. robusta grows to 2 metres tall with canes up to 10mm in diameter covered with leaf sheaths that have brown evenly spaced fine fibres. Palmate leaves have four segments that are divided nearly to the junction with the petiole. Leaflets have three to four main ribs, and are broad, being up to 50mm long and 25mm wide. Inflorescences are up to 250mm long, branched to third order, with slender branchlets that are covered with fine brownish hairs. No information is available on mature fruits.
Cultivation: Cultural requirements would probably be similar to the other species of Rhapis .

Rheum officinale — Polygonaceae !

INFO
Common Name: Chinese rhubarb
Perennial Herbaceous
Native Range: China+tibet
Description: Herbs large, 1.5-2 m tall. Rhizomes and roots stout. Stem stout, hollow, finely sulcate, with white hairs, especially above and at nodes. Petiole of basal leaf terete, ca. as long as blade or slightly shorter, pubescent; leaf blade orbicular, rarely broadly ovate, large, 30-50 cm in diam., or longer than wide, abaxially pubescent, adaxially glabrous, rarely pubescent along veins, basal veins 5-7, base subcordate; palmatilobate, apex subacute. Stem leaves smaller upward; ocrea large, to 15 cm, broad, outside with dense hairs. Panicles large; branches spreading. Pedicel 3-3.5 mm, slender, jointed below middle. Flowers 4- or 5-fascicled. Tepals 6, green to yellow-white, elliptic or narrowly elliptic, 2-2.5 × 1.2-1.5 mm. Stamens shorter than perianth. Style deflexed; stigma inflated. Fruit oblong-ellipsoid, 8-10 × 7-9 mm; wings ca. 3 mm wide, with longitudinal veins near margin. Seeds broadly ovoid. Fl. May-Jun, fr. Aug-Sep.

Rhodocoma arida Restionaceae !

INFO
Common Name:
Perennial Graminoid
Height: 5ft.
Flowers Brown
Native Range: South Africa
Description: A beautiful feature plant from the Restio family that forms a 2m high erect tussock of structural, reed like arching stems with decorative seed heads in the summer. Grows best in well-drained acid soil in full sun. Will withstand dry weather and has withstood minus 6 degrees on our nursery where the drainage is good. Also very attractive planted in a large colourful pot.
This species forms slender, whip-like stems to 6' that are often ringed at the base by fine, wiry foliage giving the plant a most unusual appearance. All parts of the plant are a dusty gray-green except for the occasional sandy-brown bracts or inconspicuous flowering clusters. Though it will tolerate seasonal wetness, this species normally prefers dry areas. Not a good choice for containers due to its large, unruly size. Hardy possibly to 30F.

Cultivation: Full sun
Record Notes: Name checked with The Plant List on 7/10/2012 by Mona Bourell.

Taxon Family Spelling Checked

Rhodocoma capensis Restionaceae !

INFO

Common Name: Mikado stems
Perennial Graminoid
Height: 4.5ft. Spread: 6ft.
Flowers Brown
Native Range: South Africa
Synonymy: Until fairly recently, the species of Rhodocoma were included in the large genus Restio.
Description: At first sight this plant does not look very reed-like, as it is much branched. The plants are about 1.5 m high and about 2 m in diameter. Each stem has a large amount of finely divided, sterile branches at the nodes, which give a 'leafy' appearance, and from June to the end of January the inflorescences add a good 500 mm to the height of the plant.

The male plants have gracefully arching inflorescences, whereas the female plants have stiff, upright inflorescences. In the southern Hemisphere an attentive gardener can observe the plants produce small, greenish yellow male flowers and white female flowers during August and September.
Cultivation: Within the first two years of planting the young plants produce a large amount of fresh green stems and establish a good root system. During the third year the plant reaches its full height, flowers and produces seed. In normal garden conditions the plants should reach an age of at least 10 years.
Like most Restionaceae this species must be grown in full sun, prefers a well-drained soil and plenty of air movement. The plants adapt to a large variety of soil types. The best time for planting restios is at the beginning of the rainy season (April-May in Western Cape), as the plants need regular watering during the first six weeks to two months after planting. After this initial period the plants can survive with a little additional watering but grow better with a normal garden-watering regime. They may be fed with standard organic fertilizers, a slow-release fertilizer or by sprinkling the surrounding soil with a small amount of ammonium sulfate during the growing season. Restios will respond to regular watering by showing more robust growth, but they are essentially plants which are adapted to a long, dry summer.

This is a fast-growing species that will be nearly 1 m high one year after sowing and will have formed a handsome

Rhodocoma fruticosa Restionaceae !

INFO
Common Name:
Perennial Graminoid
Height: 2-3ft.
Flowers Brown
Native Range: South Africa
Synonomy: Rhodocoma fruiticosa
Description: An attractive smaller variety of Restio that forms an erect tussock of very structural reed like foliage about 60cms wide and high with brown seed heads in the summer. A very ornamental plant that is equally at home in pots or containers. Similar to Rhodocoma capensis in foliage and arching stems, but smaller at 3 ft. Referenced in Journal of SA Botany - Plants of the Cape Flora as an erect tussock, to 600 mm, rhizomatous, scapes simple, male spikelets paniculate, pendent, occ. With branched sterile scapes
Cultivation: Plant individually or in-groups in a well-drained soil in full sun. Add peat or bark when planting and use a slow release fertilizer. Hardy to around -5°C.

Rhodocoma gigantea Restionaceae !

INFO
Common Name: Dekriet
Perennial Graminoid
Height: 6-8ft.
Flowers Brown
Native Range: South Africa
Synonomy: Basionym: Thamnochortus giganteus Kunth
Description: a elegant large growing plant to 6 feet tall (to 9 in native habitat) with upright stems that arch over and droop under the weight of the cushions of very finely textured, bright green, lush foliage. Male and female plants have different flowers and each are an attractive feature from when they first emerge in winter until they mature in late spring. The male flowers are dark brown spikelets that hang down along tall stems to 6- 8 feet while the female flowers are lower by several feet and have with pink hairy styles protruding from each brown spikelet. A very showy container plant. Hails from the seaward side of Langeberg and Outeniqua and Tsitsikamma mountains in South Africa.
Cultivation: Plant in full sun to part shade. Irrigate in the spring when plant are in active growth. Hardy to at least the mid 20°. Suncrest nursery reported damage to this species at 20° commenting that it "burned the foliage to a very attractive burnt orange color, but the plants recovered quickly the following spring with new shoots".
Record Notes: Name checked with The Plant List on 3/25/2013 by Mona Bourell.

Rhododendron 'Amagasa' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 6ft.
Flowers Red
Parentage: Rhododendron indicum x Rhododendron simsii.
Description: For Rhododendron hybrida (Amagasa Satsuki Azalea):
Compact, low-growing, evergreen shrub that is twiggy and dense with a spreading to rounded form. Leaves are lance-shaped to elliptic and notably smaller, 1/2 to 2 inches long, than other azalea hybrids making it the wonderful bonzai plant that it was originally bred to be. Showy, funnel-shaped, brilliant red flowers with darker red spots, 3 to 4 inches wide. Flowers are borne from May to June. Prune immediately after flowering so you won't cut off any of next year's flower buds. Plant as you would any of the other azaleas: high and in well-drained, acidic soil, rich with organic matter. This is a front of the border azalea because of its lower height. Perfect for the smaller garden. Satsukis seem to be able to handle a little more sunlight than most azaleas, but this does not mean "hot" sun. Filtered light is still best. Though azaleas have a potentially large list of possible pest and disease problems, they are usually trouble free if planted correctly in proper cultural conditions.
Important Info : This Japanese azalea is a hybridization between Rhododendron indicum and Rhododendron simsii.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 12/15/2009.
A "Satsuki Azalea ".

Rhododendron 'Cornubia' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 20 [7 int 10years]ft.
Flowers Red Dec, Jan
Parentage: R. 'Shilsonii' (R. barbatum x R. thomsonii) x R. arboreum 'Blood Red'
Description:
Rhododendron 'Cornubia' is one of the few hybrid rhododendrons cultivated in the UBC Botanical Garden collection. The parentage of this beautiful plant includes three Himalayan species, all of them superb in their own right and all of them cultivated in our collection. The cross is Rhododendron 'Shilsonii' (Rhododendron barbatum × Rhododendron thomsonii) × Rhododendron arboreum 'Blood Red'.

Hybridiser: Fox, R.B.. Penjerrick, Cornwall, UK, 1912

Rhododendron 'Cristo Rey' Ericaceae !

INFO Common Name:
Perennial Shrub
Height: 3ft. Spread: 5ft.
Flowers Orange, Yellow Summer, Fall
Parentage: (macgregoriae x zoelleri) x (laetum x zoelleri)
Description: Fabulous tangerine and gold tubular flowers have made vireya rhododendrons the showiest shrubs of the tropical landscape. In the wild they thrive under a jungle canopy making an ideal dose of strong color foliage for shaded sites. Blooms over many months from late summer to fall in trusses of up to 7 flowers each. Prefers well drained acidic soil allowed to dry out between waterings. Super foundation plant or use in high profile front yard groupings. Grow inside greenhouses conservatories or larger commercial building atriums. Evergreen, upright habit. Slow to moderate growth to about 3 or more feet tall and 5 feet wide.
Cultivation: Shade or part shade. Follow a regular watering schedule during the first growing season to establish a deep, extensive root system, but allow the soil to dry out between waterings. Provide well drained soil, rich in organic matter. Feed with an acid fertilizer after bloom.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: P. Sullivan hybrid; In Section Vireya of Subgenus Rhododendron. Culitvar name checked in http://www.vireya.net/hybridlistsC.htm

Rhododendron 'Cynthia' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 6-10ft.
Flowers Pink Mar, Apr, May
Not Invasive
Parentage: Rhododendron catawbiensis × griffithianium
Description: Broadleaf evergreen shrub, 8 ft (2.1 m). Leaves medium to large, ca. 16 x 6.5 cm, flat, oblong elliptic to slightly obovate, rounded apex. Red-pink flowers midseason, funnel-shaped, ribbed, about 3-1/8" across, dark blotch mostly on middle lobe, stamens and filament pink, Held in conical trusses of up to 24 flowers. Elepidote. Cultivar introduced before 1870 by Standish & Nobel. American Rhododendron Society Registration Reference: RHS 58.
Record Notes: Spelling checked on American Rhododendron Society website. 2/27/2007.

Rhododendron 'Daphnoides' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft.
Description: (probably a variant of R. ponticum)
Broadleaf evergreen shrub, 4 ft (1.2 m). Distinctive dark green convex leaves (unlike any other rhododendron), to 7.5 x 2.5 cm, tightly spaced on stem, rosette form. Flowers deep purple, medium sized, indistinct yellow blotch, small pompom clusters.
Introduced in 1868.

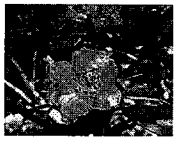

image of © 2009 Mona Bourell, SFBG1996-0371

Cultivation: -15o F, mid-late, quality rating 2-3/4/4 [flower / plant & foliage / performance; scale 1 (poor) - 5 (best)]. Sun to part shade.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Nothing found in IPNI and Tropicos. After a Google search, a site from Oregon State University says it is Rhododendron ponticum 'Daphnoides'. Further research is needed. A Kennedy 1/29/07.

Rhododendron 'Eikan' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 6ft.
Parentage: Rhododendron indcum x Rhododendron simsii
Description: This Japanese azalea is a hybridization between Rhododendron indcum and Rhododendron simsii and has a compact, low, spreading to rounded form that is twiggy and dense. Even the leaves are notably smaller, making it the wonderful bonzai plant that it was originally bred to be. Grows 2 to 4 feet tall and wide. Eikan has large, showy, funnel-shaped flowers that are ruffled, white with pink markings, blooms in late spring. Plant as you would any of the other azaleas: high and in well-drained, acid soil, rich with organic matter. This is a front of the border azalea because of its lower height. Perfect for the smaller garden. Satsukis seem to be able to handle a little more sunlight than most azaleas, but this does not mean "hot" sun. Filtered light is still best. The Satsuki are often pruned in the the Japanese garden. If this is the look you are trying to obtain, remember, prune immediately after flowering, so you won't cut off any of next years buds. Though azaleas have a potentially large list of possible pest and disease problems, they are usually trouble free if planted correctly in proper cultural conditions.
Important Info : This Japanese azalea is a hybridization between Rhododendron indcum and Rhododendron simsii.

image of 4/1/ M. Lewis

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 12/15/2009.

Rhododendron 'Fragrantissimum Improved' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 3ft.
Flowers White Apr, Mar
Parentage: edgeworthii x formosum var formosum
Description: Flower funnel-shaped, wavy edges, very fragrant, white blushed pink. Held in trussels up to 5 flowers.

Foliage is medium-sized, dark green, puckered as in the seed parent. Habit is vastly superior to Fragrantissimum - much tighter growing and more compact; it is an upright, well-branched plant that is easy to grow where adapted.
Record Notes: Cultivar name found used in the trade with internet search, 4/20/2009.

Taxon Family Spelling Checked

Rhododendron 'Fragrantissimum' Ericaceae !

INFO

Common Name:
Perennial Shrub
Height: 4-6ft.
Flowers White Feb, Mar, Apr
Native Range: Asia
Parentage: edgeworthii x formosum var formosum
Description: Flower broadly funnel-shaped, wavy-edges, about 2½" across, fragrant, white flushed rose outside and a bright yellow throat. Held in lax trusses of about 4 flowers.
Leaves ovate, oblong-ovate or obovate, broadly acute apex, cuneate base, 3½" long, rugose, hairy, olive green, retained 2 years. Very leggy growth habit.
Hybridizer: Rollisson

image of © 2008 Mona Bourell, SFBG1991-0931

Perhaps the most widely known FRAGRANT rhododendron, 'Fragrantissimum' won the First Class Certificate in 1868, and is still as popular today. Sometimes known as "The Himalayan Rhododendron", it is not really from the Himalayas, but has parents that are from that part of the world. This plant will benefit from yearly light pruning and will eventually grow into a large shrub 8 ft. tall and the same wide. The honeysuckle fragrance is most potent on warm days, often drifting 50 ft. or more. Unfortunately, this plant is tender and can't take temperatures lower than 25 F. If containerized, it can be taken into a greenhouse for the winter in colder areas, then brought back out for spring enjoyment. 'Fragrantissimum' does well trained up a lattice or a fence, rewarding you with a wall of sweetly scented blooms. This fragrance can take you back a hundred years!

image of 4/1/ W.R. Valen

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked on 7/21/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Bed 72D - Rhododendron Garden- bed immediately west of Pavilion Qty:1
Pl: Ckd:1/27/2009 Jason Martinez
2 plants separated from each other toward W side, central bed. #11 on bed inventory map.

Notes

11/17/2010 Mona Bourell — Jason reports only one plant in 72A. Qty changed from 2 to one.

8/29/2007 David Kruse-Pickler — 3 plants moved for Rhody staging.

11/1/2006 Tony Morosco — I believe these plants may be an unrecorded donation from Peter Good of Goodscapes, that arrived with some Hydrangea sp., Astelia nivicola, and Acer palmatum. Further research needed.

11/1/2006 Mona Bourell — Source uncertain. The 4 plants have been in unmarked plants in 0V for some time. Jim Henrich thinks they may be from an Enjoy order of Georgia Madden, Feyerabend & Madden Landscape Design; or donated by Paul Molinari of Enjoy Rhododendrons, Occidental, CA . Nan Ray, volunteer and Rhododendron expert identified these plants.

Taxon Family Spelling Checked

Rhododendron 'Fukuju'

Ericaceae X

INFO

Common Name:
Flowers Greens, pinks, whites, yellows
Parentage: Rhododendron indicum and Rhododendron simsii
Description: Compact, low-growing, evergreen shrub that is twiggy and dense with a spreading to rounded form. Leaves are lance-shaped to elliptic and notably smaller, 1/2 to 2 inches long, than other azalea hybrids making it the wonderful bonzai plant that it was originally bred to be. Showy, funnel-shaped, white and yellowish-pink variegated flowers with green markings, 4 to 4 1/2 inches wide. Flowers are borne from May to June. Prune immediately after flowering so you won't cut off any of next year's flower buds. Plant as you would any of the other azaleas: high and in well-drained, acidic soil, rich with organic matter. This is a front of the border azalea because of its lower height. Perfect for the smaller garden. Satsukis seem to be able to handle a little more sunlight than most azaleas, but this does not mean "hot" sun. Filtered light is still best. Though azaleas have a potentially large list of possible pest and disease problems, they are usually trouble free if planted correctly in proper cultural conditions.
Important Info : This Japanese azalea is a hybridization between Rhododendron indicum and Rhododendron simsii.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 12/15/2009.

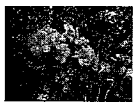
Rhododendron 'George Budgen' Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Orange, Yellow Apr, Nov
Parentage: laetum x zoeleri
Description: A hybrid of R. laetum x R. zoeleri, named after the founder of Berkeley Hort Nursery. [http://www.calhortsociety.org/Plant_Forums/jan2003/source/jan2003-08.html]



This vireya rhododendron is a hybrid of R. laetum x R. zoeleri, named after the founder of Berkeley Hort Nursery. It has large 1-1/2" to 2" salmon-yellow flowers with orange tips in trusses of 6-10. Like all vireyas it can bloom year round since they are subtropical. Heaviest bloom is in early spring and mid-autumn. They can be grown with regular rhododendrum conditions but also can be grown as epiphytes, either in hanging baskets or mounted on cork. They are cold sensitive and only tolerate light frosts. They also do not like sustained hot temperatures as they generally come from higher altitudes. They need good air circulation as they can be prone to mildew under stale air conditions.

Rhododendron 'Gumpo Pink' — Ericaceae ?

INFO
Common Name: Satsuki Azalea
Perennial Shrub
Height: 2ft. Spread: 3ft.
Flowers Pink
Parentage: R. indicum X R. tamurae
Description: Azalea 'Gumpo Pink' (Satsuki hybrid)

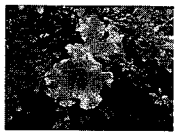

image of © 2009 Mona Bourell, SFBG1999-1158

Deciduous/evergreen: Evergreen
Average landscape size: Slow growing to 2 ft. tall, 3 ft. wide.
Growth rate: Slow
Landscape use: Seacoast Exposure
Flower color: Pink
Blooms: Late spring
Cultivation: Filtered, partial sun. Avoid prolonged direct exposure to spring and summer sun.

Cold hardiness zones: 7 - 9
Light needs: Filtered sun
Water Needs: Needs regular watering - weekly, or more often in extreme heat.

Follow a regular watering schedule during the first growing season to establish a deep, extensive root system. Provide well drained soil, rich in organic matter. Feed with an acid fertilizer after bloom. Keep roots cool with a thick layer of mulch.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked on 10/10/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Rhododendron 'Haru no Hikari ' Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Light Purplish Pink; white/pink variegated
Description: Flowers to 10 cm across
Compact, low-growing, evergreen shrub that is twiggy and dense with a spreading to rounded form. Leaves are lance-shaped to elliptic and notably smaller, 1/2 to 2 inches long, than other azalea hybrids making it the wonderful bonzai plant that it was originally bred to be. Showy, funnel-shaped, white and pink variegated flowers, 3 to 4 inches wide. Flowers are borne from May to June. Prune immediately after flowering so you won't cut off any of next year's flower buds. Plant as you would any of the other azaleas: high and in well-drained, acidic soil, rich with organic matter. This is a front of the border azalea because of its lower height. Perfect for the smaller garden. Satsukis seem to be able to handle a little more sunlight than most azaleas, but this does not mean "hot" sun. Filtered light is still best. Though azaleas have a potentially large list of possible pest and disease problems, they are usually trouble free if planted correctly in proper cultural conditions.
Important Info : This Japanese azalea is a hybridization between Rhododendron indicum and Rhododendron simsii.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 12/15/2009.

Rhododendron 'Helene Schiffner' Ericaceae X

INFO
Common Name:
Perennial Shrub/tree
Flowers White
Description: This plant has dark flower buds open [5cm] pale lilac, turning to pure white with faint yellowish brown markings. It forms an upright dome shaped truss in May. With attractive narrow leaves and reddish stems, it does like some shade. An old hybrid that is slower growing with an upright habit. Height 120-150cm in 10 years.

image of © 2008 Mona Bourell SFBG

Recommended for: Attractive foliage.
Easy to grow.
Ideal position: Dappled shade.
Habit: Open.
Group: Hybrid Rhododendron.
Parentage: Parentage unknown.
Hybridization date: pre 1900 (c. 1890).
Bred by: T.J.R. Seidel. Origin: German.
Ideal soil: pH 4.5 to 6.
RHS Hardiness Rating: H4.
How we usually propagate this plant: Cutting.
Awards: RHS Award of Garden Merit.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Mona Bourell

Rhododendron 'Kaponga' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 6ft. Spread: 6ft.
Flowers Red
Parentage: R. arboreum ssp arboreum x R. 'Ivery's Scarlet'

Description: A larger growing Rhododendron with a strong upright growth habit. Long dark green leaves have a silvery underside. Bred in New Zealand, it is an early flowerer. Large trusses of scarlet- red flowers.

Hybridizer: Holland B., New Zealand, 1979

Seed parent: R. arboreum ssp arboreum
Pollen parent: 'Ivery's Scarlet'

Cultivation: Rhododendron's prefer dappled shade, but can be grown in full sun if protected from afternoon sun or kept well watered. They need soil that is well worked and doesn't dry out. Applying mulch will aid in keeping in moisture and keeping their roots cool. Rhododendron's have what is known as a fibrous root system, which is a fine series of roots close to the surface. This means Rhododendron's don't like a lot of soil disturbance as it can damage their roots and encourage diseases.
Record Notes: Name checked on 9/25/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

this specimen is probably actually 1993-0664, as it has an old accession tag for this number.

Notes
1/11/2007 It looks like the tag and sign ordered 11/16/06 by Nan Ray was in error, as the plant that she referred to had an existing accession tag of 1993-0664, which is also a leucogigas derived hybrid. Sent note to Don Mahoney, asking him to discuss the ID of the specimen in question with Nan Ray and Jim Queen (now moved to 0L5 without being reported as moved from 0D3).
Tony Morosco

11/16/2006 Reported by volunteer Nan Ray of at least one plant in bed 0D3 on top of bench in bloom. She said it had an accession tag of "accession number and the name 'Rhododendron hybrid'" and requested replacement tag, tag ordered, make sure accession numbers match when placing. Updated location record for bed 0 from qty 2 to qty 1, and added location record for
Tony Morosco

Rhododendron 'Loderi Game Chick' Ericaceae !

INFO
Common Name:
Perennial Shrub
Parentage: R. griffithianum × R. fortunei
Description: General aspect and origins - Rhododendron 'Loderi' is a cross between R. Griffithianum × R. Fortunei. It is an evergreen small tree that can be up to 21 ft (7 m) tall. It has evergreen leaves, and pink to white fragrant flowers.
Leaves - Leaves of 'Loderi' are light-green to emerald-green, with a brown leaf stem. Leaves sometimes droop.

image of © 2009 Mona Bourell, SFBG1999-0977

Note : In spring, flower and leaf buds tend to open at the same time.
Flowers - Inflorescences group 9 to 12 large flowers, which are pure white to deep-pink. However, flower buds are always pink. The flowers are fairly to strongly fragrant, depending on many factors (including exposition, heat, daytime, etc.)

There are many cultivars of Rhododendron 'Loderi', among which :
'Loderi Game Chick' - Silvery pink flowers with pink traces in the center.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Originally in record as Rhododendron loderi 'Game Chick'; according to Royal Hort. Society "loderi" is part of the cultivar name, 4/21/2009.

Rhododendron 'Mrs. E. C. Stirling' Ericaceae !

INFO Common Name:
Perennial Shrub
Height: 6 ft in 10 yearsft.
Flowers Pink, age to white Mar, Apr, May, Feb
Parentage: R. griffithianum x unknown
Description: Flower mauve pink with a paler center, unmarked, widely funnel-shaped, wavy lobed, about 3 -1/2" across. Flowers age to white. Conical-shaped truss holds about 17 flowers. Blooms midseason to late midseason. Leaves medium-sized, dark green. Growth habit upright and leggy when young, later spreading and open. Grows to a typical height of about 6 ft. in 10 yrs. Cold hardy to -5°F (-21°C)

At St Vigeans Garden in Australia, Dr Stirling's love of rhododendrons led to the importation of many different varieties, and the famous English rhododendron nursery of John Waterer named one of its new varieties 'Mrs E.C. Stirling', after his wife.
Cultivation: . Hybridized by J. Waterer.
Record Notes: Cultivar name found used in the trade with internet search, 8/31/2009.

Rhododendron 'Mysterious Maddenii' Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White
Description: Powerful FRAGRANCE from huge 6" white flowers that have tints of pink and yellow. The loose, open habit is perfect for use as a cascade or to train up a trellis, creating a wall of fragrance. Heat tolerant. The bark exfoliates and has a "manzanita" look...rich reds and browns and silver hues. Plant on a raised hill or above a retaining wall and let this plant create wonderful interest and scented air.
Record Notes: Name checked on 5/14/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Rhododendron 'Senator Henry Jackson' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft.
Flowers White, Pink
Parentage: R. degronianum ssp yakushimanum x R. 'Mrs Horace Fogg'
Description: WHITE flowers are probably the best yet having a large pedale pealed back with full truss.
Middle to Late blooming. Plant in locations which provide sun protection for flowering.
INDUMENTED Conves leaves are pointed like 'hyperythrum'. Light white indumentum.

Seed Parent x Pollen Parent:
degronianum ssp yakushimanum x Mrs Horace Fogg
Flower / Truss Description: Flower white. Held in ball-shaped trusses.
Bloom Time: Late Midseason
Height (ft.) in 10 Yrs: 3
Foliage Description / Plant Habit: Leaves convex, dark green, with sparse white indumentum.
Elepidote
Hybridizer: Larson
Registration Reference: not registered

Cultivation: Cold Hardiness Temperature:
-5°F (-21°C)
Record Notes: Originally in the record as R. 'Senator Jackson'; name checked with the Am. Rhododendron Society website, 4/7/2008.

Rhododendron 'Unique' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft.
Parentage: R. campylocarpum
Description: # Broadleaf evergreen, 4 ft (1.2 m), dense, symmetrical. Leaves alternate, simple, broad-elliptic or occasionally slightly obovate, smooth, 10 x 4.5 cm, obtuse, usually with a 1 mm point (mucro), medium green above, lighter below. Flower buds pink-red then apricot, when open ivory flushed with pink, fade to nearly white, delicate blotch, corolla funnel-campanulate, 6 cm wide, anthers pale brown, stigma red; up to 14 flowers per tight cluster.
- 5o F, early-mid, 3/4-5/4 [flower / plant & foliage / performance; scale 1 (poor) - 5 (best)]. Sun to part shade.
There is a pink-flowered version known as 'Bruce Brechtbill'. This cultivar is a bud sport of 'Unique' and "looks and acts identical to 'Unique' until it flowers" (Greer, 1996). The flowers are pink with some yellow in the throat. 'Bruce Brechtbill' is planted at River Front Park, Corvallis.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 1/4/2011.

Rhododendron adenopodum — Ericaceae !

INFO
Common Name: Rhododendron
Perennial Herbaceous
Native Range: China
Description: Shrubs, evergreen, 2–3 m tall; bark gray; young shoots with a dense grayish tomentum and a few glandular hairs. Petiole 10–15 mm; leaf blade leathery, obovate-elliptic or long-obovate, 6–13 × 2–4 cm; base cuneate; apex acuminate, shortly curved-cuspidate; abaxial surface indumentum grayish to pale fawn; adaxial surface glabrous when mature; midrib prominent abaxially, grooved adaxially; lateral veins 10–12-paired, inconspicuous. Inflorescence a lax racemose corymb, 4–8-flowered; rachis 10–15 mm, with a fawn-tomentum. Pedicel 1–2.5 cm, with glandular hairs; calyx lobes 5, 3–5 mm, membranous glandular on the back, triangular-ovate, margin glandular-ciliate; corolla funnel-campanulate, pale rose, usually crimson-spotted, 4–4.5 cm, puberulent within at the base, outside glabrous, lobes 5, orbicular, ca. 1.5 × 2 cm; stamens 10, unequal, 1.5–3 cm, filaments densely hairy in lower 1/4; ovary ovoid, ca. 5 mm, ca. 5–6-locular, densely clad with long-glandular hairs; style slender, glabrous. Capsule oblong-cylindric, ca. 15 × 7 mm, glandular. Fl. Apr–May, fr. Jul–Aug.
Native habitat: Thickets, mountain slopes, roadsides; 1000–2200 m. Chongqing, W Hubei.

Record Notes: Name checked with the Flora of China, 4/14/2010.

Taxon | Family Spelling Checked

Rhododendron agastum — Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Native Range: China
Description: Shrubs, 2–3 m tall, older branches glabrescent, branches stout; young shoots thinly floccose and sparsely glandular. Petiole cylindric, 10–20 mm, pubescent and glandular-hairy; leaf blade leathery, elliptic to ovate-elliptic, 7–12 × 2–5 cm; base rounded or cuneate; margin entire; apex obtuse or slightly cuspidate or acute to acuminate; abaxial surface indumentum thin, pale olive to fawn, veil-like; adaxial surface green, glabrous, midrib prominently raised abaxially; lateral veins 12–13-paired, slightly impressed. Inflorescence racemose-umbellate, 5–10-flowered; rachis 15–30 mm, pubescent and glandular. Pedicel stout, 1–1.5 cm, glandular; calyx discoid; lobes 5–7, minute, glandular and gland-fringed; corolla tubular-campanulate, pink, with crimson blotch, 3.5–5 cm, nectar pouches at base, glabrous within, lobes 5–7, suborbicular, 1.5–1.7 × 2–2.2 cm, emarginate; stamens 10–14, unequal, 2–3 cm, filaments pubescent at base; ovary cylindric-conoid, ca. 6 mm, glandular-hairy, with a few strigose hairs or tomentose; style stout, 2.5–4 cm, glandular to tip or glabrous; stigma slightly swollen, discoid. Capsule curved, ca. 30 × 10 mm. Fl. Apr–May, fr. Jul–Aug.
Leaf apex obtuse or rounded; filaments pubescent in lower half; style glandular to tip; corolla 5-lobed.

Rhododendron agastum is probably a hybrid between R. decorum and R. delavayi, as suggested by field observations at the type locality (Yangbi, near Dali in W Yunnan) and as mentioned by George Forrest in the field notes accompanying the type specimen. This entity would not, therefore, belong in R. subsect. Irrorata, as given in FRPS (57(2): 130. 1994) and here.

Also see Zhang, J.-L. et al. 2007. Natural hybridization origin of Rhododendron agastum (Ericaceae) in Yunnan, China inferred from morphological and molecular evidence. J. Plant Res. 120: 457-464.

Taxon Family Spelling Checked

Rhododendron anthopogon Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pink or yellowish white
Native Range: India
Description: Small shrubs, often prostrate or decumbent, (0.3–)0.5–1 (–1.5) m tall; branchlets loose, intricate, scaly, sparsely setose; bud scales deciduous. Petiole 3–8 mm, scaly; leaf blade aromatic, obovate-elliptic, ovate, rarely orbicular, (1.5–)2.5–3.5 (–4) × 1–1.6(–2.5) cm; base rounded; apex obtuse or rounded, mucronate; abaxial surface scales overlapping, dark reddish brown and dark yellow-brown, arranged in 2–3 tiers, often those of the lowest tier darker than rest; adaxial surface dark green, shiny, usually sparsely scaly. Inflorescence 4–6(–9)-flowered. Pedicel 0.2–0.4 cm, scaly; calyx lobes 3–5(–6) mm, elliptic or oblong, persisting to enclose mature capsule, scaly, margin densely ciliate; corolla narrowly tubular-funnelform, pink, or yellowish white, tube 6–12 mm, outer surface not scaly; inner surface densely pilose; lobes spreading, 1.2–2 cm; stamens (5–)6–8(–10), included in corolla tube, filaments glabrous; ovary ca. 1 mm, scaly; style short, thick, straight, as long as ovary, glabrous. Capsule ovoid, 3–5 mm, scaly. Fl. Apr–Jun, fr. Jul–Aug.
Thickets, open slopes, hillsides, cliff ledges; 3000–4500(–5000) m. S Xizang [Bhutan, N India, Nepal, Sikkim].

Taxon Family Spelling Checked

Rhododendron anthosphaerum Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Flowers Pink to deep rose to lilac early spring
Native Range: Myanmar, China
Description: Shrubs or small trees, 2–7 m tall; young branches stout, glabrous. Leaf blade thinly leathery or leathery, elliptic-oblanceolate or long-elliptic, 8–14 × 2.5–3.5 cm; base cuneate; margin revolute; apex acuminate to acute, apiculate; abaxial surface pale, thinly clad with scattered hairs; midrib prominent; lateral veins 17–24-paired. Inflorescence racemose-umbellate, 8–10-flowered; rachis 5–10 mm, floccose. Pedicel 1–1.5 cm, sparsely rufous-tomentose or glabrescent; calyx cupular, lobes 6 or 7, ca. 1 mm; corolla tubular-campanulate, rose-magenta or crimson to magenta-blue, with a basal black-crimson blotch, 3–3.5 cm, nectar pouches present; lobes 6 or 7, suborbicular, ca. 1 × 1–1.5 cm, emarginate, crenate; stamens 13–14, unequal, 1.5–2.5 cm, filaments slender, glabrous or puberulent at base; ovary cylindric, ca. 5 × 2.5 mm, glabrous; style as long as corolla, glabrous, stigma small. Capsule 15–25 × 6–8 mm, glabrous, 7–8-lobed at apex when dry. Fl. Apr–May, fr. Jul–Aug.

Cultivation: A shade tolerant and strong grower
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron aperantum — Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White, yellow flushed pink to orange or rose
Native Range: Myanmar, China: Yunnan
Description: Dwarf matted shrubs, 0.3–0.6 m tall; young shoots floccose-tomentose; bud scales persistent. Petiole broad, 3–6 mm, floccose, glabrescent; leaf blade leathery, obovate to oblanceolate, 3–6.5 × 1.4–2.4 cm; base cuneate; apex rounded, apiculate; abaxial surface glaucous, papillate, glabrous when mature, sometimes with vestiges of reddish brown or whitish indumentum persisting on main veins and midrib; adaxial surface green, rugose, glabrous. Inflorescence lax, 4–6-flowered; rachis ca. 2 mm. Pedicel 1.5–3 cm, floccose-tomentose and glandular-hairy; calyx cupular; lobes 5, 3–6 mm, glandular-ciliate, otherwise glabrous; corolla tubular-campanulate, white, yellow flushed pink to orange or rose, 3–4.5 cm, lobes 5, rounded, ca. 1.3 × 2 cm, glabrous; stamens 10, 1.3–2.5 cm, filaments glabrous; ovary conoid, ca. 5 mm, rufous-tomentose, and glandular-setose; style ca. 2.2 cm, glabrous. Capsule oblong, 12–20 × 4.2–7 mm; calyx persistent, tomentose. Fl. Jul, fr. Oct.
Native habitat: Rhododendron thickets, cliffs; 3600–4500 m. NW Yunnan [NE Myanmar].

Record Notes: Originally in record misspelled as Rhododendron apernatum. Name checked in the Flora of China, 4/14/2010.

Rhododendron arboreum — Ericaceae !

INFO
Common Name:
Perennial Tree
Height: 15-90 ft.ft.
Flowers White, Pink, Red Spring
Native Range: Northern India, Bhutan, China, Thailand, and Sri Lanka
Description: Small to large trees, 5-30 m, with a well-defined trunk. Leaves leathery, 6.5-19 cm long by 1.8-6 cm wide, narrowly to broadly elliptic or ovate, upper surface with more or less deeply impressed veins, lower surface with compacted to dense and spongy withe to fawn indumentum composed of dendroid hairs, occasionally also with loose floccose rufous upper layer. Flowers 10-20, in dense truss, white or pink to deep crimson-red, with dark purple flecks and nectar puches, fleshy, tubular-campanulate, 30-50mm. This is one of the most widespread and variable species of Rhododendron.
Its name means 'tending to be woody or growing in a tree-like form'.
Trees, usually evergreen, (1–)5–20(–30) m tall; trunk well-defined; bark gray-brownish, exfoliating into thin and small irregular flakes; young shoots stout, with distinct leaf traces, densely grayish tomentose, glabrescent. Winter buds ovoid, 10–12 × 5–6 mm, puberulent. Petiole 10–25 mm with dense fawn indumentum intermixed with glands, sometimes glabrescent; leaf blade leathery, oblong-lanceolate or oblong-oblanceolate, 6–15 × 2–4.5 cm; base cuneate or ± rounded; margin revolute; apex acuminate or acute; abaxial surface with indumentum 1- or 2-layered, densely compacted, white to fawn tomentose, sometimes with loosely floccose brown upper layer, hairs dendroid, glabrescent; adaxial surface reticulate to bullate, glabrous; midrib deeply impressed adaxially; lateral veins 15–26-paired. Inflorescence dense, ca. 20-flowered, rachis 10–15 mm, tomentose. Pedicel ca. 0.9 cm, pilose, glandular; calyx lobes 5, 1–2 mm, small, triangular, sparsely glandular and hairy; corolla tubular-campanulate, pink to deeply crimson, rarely white, 3.5–4 cm, with 5 black-blotched basal nectar pouches and dark flecks; lobes 5, 1.2–1.7 cm, apex emarginate; stamens 10, unequal, 1.7–2.7 cm, filaments glabrous; ovary conoid, 4–6 mm, white-tomentose, sometimes also glandular; style ca. 3.3 cm, glabrous. Capsule cylindric, ca. 30 × 6 mm. Fl. May, fr. Aug.

Rhododendron arboreum ssp. albotomentosum 'Dr. Bowman' !

Ericaceae

INFO
Common Name:
Perennial Shrub
Height: 15ft. Spread: 6ft.
Flowers Red Spring
Synonomy: Rhododendron delavayi Franch.var. albotomentosum Davidian
Description: The subspecies albomentosum is rare in the wild, known only from a single mountain in North Burma (Mt. Victoria). This cultivar originates from McLaren Rhododendron Dell in SF Golden Gate Park, possibly planted in 1940's. The subspecies albomentosum is rare in the wild, known only from a single mountain in North Burma (Mt. Victoria).
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Originally in records as ssp. albomentosum. Species/ssp. names checked with IPNI, 4/6/2007.
Originally in the record as Endangered which is not applicable to cultivars.

Taxon Family Spelling Checked

Rhododendron arboreum ssp. arboreum

Ericaceae !

INFO
Common Name:
Perennial Tree
Height: 15-90 ft.ft.
Flowers White, Pink, Red Spring
Native Range: Bhutan
Description: Small to large trees, 5-30 m, with a well-defined trunk. Leaves leathery, 10-19 cm long by 2.5-5 cm wide, narrowly to broadly elliptic or ovate, upper surface with more or less deeply impressed veins, lower surface with white to silvery compacted indumentum. Flowers 10-20, in dense truss, crimson. This is the common subspecies across the Indo-Himalayas. In cultivation it is relatively tender.
Record Notes: Name checked in The Rhododendron Handbook 12/2/2005.

ACCESSION
SFBG# 1976-0042 DEACCESSIONED Rec'd: 1/1/1976

Rhododendron arboreum ssp. cinnamomeum

Ericaceae !

INFO
Common Name:
Perennial Tree
Height: 15-90 ft.ft.
Flowers White, Pink, Red Spring
Native Range: Bhutan
Description: Small to large trees, 5-30 m, with a well-defined trunk. Leaves leathery, 6.5 -11 cm long by 2.2 -4.5 cm wide, narrowly to broadly elliptic or ovate, upper surface with more or less deeply impressed veins, lower surface with white to cinnamon compacted indumentum. Flowers 10-20, in dense truss, white - crimson. E. Nepal and China (S. Tibet) to Bhutan and Arunachal Pradesh. 2750-3650 m. This subspecies tends to have a more Easterly distribution than does ssp. arboreum, and occurs at higher elevations. It is therefore rather hardier in cultivation.
Record Notes: Name checked in The Rhododendron Handbook 12/2/2005.

Rhododendron arboreum ssp. zeylanicum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Red
Native Range: Sri Lanka
Synonomy: Rhododendron zeylanicum T. J. Booth
Description: Rare ssp from the highlands of Sri Lanka, named after Zeilan, the name used by arabian traders to refer to Sri Lanka.
Species description: Its name means 'tending to be woody or growing in a tree-like form'. It has been recorded as reaching heights of up to 20 m[1], although more usually it has a height and spread up to 12m (36ft) x 12m (36ft).

In early- and mid-spring, trusses of 15-20 bell-shaped red flowers, 5 cm (2in) wide and 3-5 cm (1.25-2in) long. They have black nectar pouches and black spots inside.

Record Notes: Name checked with GRIN, 4/23/2008.

Rhododendron arizelum Ericaceae !

INFO
Common Name: Rhododendron
Perennial Tree
Height: 20'ft.
Flowers Yellow Apr, May
Native Range: Burma+china+tibet
Description: Trussels of long campanulate yellow flowers with a dark crimson blotch. Shoots with a velvety, cinnamon brown or greyish felt. Leaves dark green above with a thick, cinnamon or brown felt below. Flowers in trussels of 15-25, 1.5-2" long.

Big LeafShrubs or small trees, 3–7 m tall; branchlets stout, rough, usually ca. 10 mm in diam.; young shoots pale brown tomentose, glabrescent. Petiole terete, 20–30 mm, tomentose, glabrescent; leaf blade leathery, obovate or obovate-elliptic, broadest above middle of blade, 9–19 × 4–8 cm; base cuneate; apex rounded, emarginate; abaxial surface with pale brown or rufous, 2-layered indumentum, upper layer brown, hairs narrowly cup-shaped, strongly fimbriate, lower layer thin, compacted, gray; adaxial surface deep green, glabrous, midrib prominent abaxially, flat or slightly impressed adaxially, lateral veins 10–13-paired, prominent abaxially. Inflorescence 15–20-flowered; rachis 15–25 mm, densely tomentose. Pedicel 1.2–2 cm, densely tomentose; calyx oblique; teeth 8, ca. 1 mm; corolla campanulate, white, pale yellow or pink, with crimson basal blotch, 3.5–4.5 cm, lobes 8, suborbicular, ca. 1 × 1.5 cm, emarginate; stamens 16, 1.5–2.5 cm, filaments glabrous or puberulent at base; ovary terete, densely tomentose; style glabrous. Capsule 30–40 × ca. 10 mm, tomentose. Fl. May–Jun, fr. Aug–Sep.

Rhododendron arizelum var. rubicosum Cowan & Davidian (Rhododendron Year book 8: 79. 1953), described from NW Yunnan, is a rich red- to purple-flowered form, which may be intermediate between R. arizelum and R. rex subsp. fictolacteum.

Rhododendron asterochnoum Ericaceae !

INFO
Common Name:
Perennial Tree
Height: 20-50ft.
Flowers Pale pink to white
Native Range: China: Sichuan
Description: Small trees, 3–7(–15) m tall; bark gray; older branches brownish, glabrous; young shoots densely tomentose. Petiole winged, 15–30 mm, tomentose when young; leaf blade leathery, broadly oblanceolate, rarely oblong-elliptic, 17–26 × 3–9 cm; base cuneate; apex obtuse or rounded, apiculate; abaxial surface pale green, indumentum discontinuous, sparse and whitish, hairs stellate; adaxial surface green, glabrous, midrib grooved adaxially, lateral veins 19–23-paired. Inflorescence 11–18-flowered; rachis ca. 17 mm, with whitish stellate hairs. Pedicel 3–6 cm, glabrescent; calyx teeth 4 or 5, 1.5–2 mm, unequal; corolla campanulate, pale pink to white, 3–5 cm, lobes 5, ca. 1.8 × 2.5 cm, emarginate; stamens, 18–20, 1.2–2.6 cm, filaments pubescent at base; ovary conoid, 5–6 mm, glabrous; style ca. 3 cm, glabrous; stigma swollen, discoid, 5–5.5 mm in diam. Capsule oblique, 15–30 × 9–11 mm. Fl. May, fr. Jul–Aug.
Forests, valleys, roadsides; 2200–3600 m. W Sichuan
Cultivation: Easy in light shade.
Record Notes: Name checked with the Flora of China, 5/1/2008.

Rhododendron augustinii Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China+tibet
Description: Shrubs, 1–5 m tall; young shoots scaly, densely villous and pubescent or glabrous. Petiole 3–5 (–10) mm, densely hispid and pubescent or glabrous; leaf blade elliptic, oblong or oblong-lanceolate, 3–7 × 1–3.5 cm; base cuneate to rounded; apex acuminate to acute, apiculate; abaxial surface scales (1–)1.5–5 × their own diameter apart, unequal, densely yellowish white-pubescent along lower half of midrib, mature leaves less hairy; adaxial surface scales absent or sparse to dense, densely or sparsely pubescent, with filiform-acicular hairs along midrib. Inflorescence terminal, umbellate, 2–6-flowered; rachis ca. 5 mm, glabrous. Pedicel 0.8–1.5 cm, sparsely scaly, pubescent or glabrous; calyx lobes 0.5–2 mm, rounded or triangular, densely scaly, densely pubescent or glabrous; corolla broadly funnelform-campanulate, 5-lobed to middle, blue to lavender, sometimes pale pinkish purple or white, 3–3.5 cm, outer surface glandular scaly or not, glabrous or pubescent at base; lobes oblong; stamens unequal, 2.5–3.5 cm, longer than corolla; filaments densely villous below; ovary 5-locular, densely scaly; style longer than corolla, glabrous or pubescent at base. Capsule cylindric; base oblique, 10–20 mm, densely scaly. Fl. Apr–May, fr. Jul–Aug.

Leaf midrib abaxially with indumentum extending from petiole, scales 1.5–2 × their own diameter apart; adaxial leaf surface with filiform-acicular hairs on veins.

Perennial Shrub
Flowers Lavander
Description: Shrubs, 1–5 m tall; young shoots scaly, densely villous and pubescent or glabrous. Petiole 3–5 (–10) mm, densely hispid and pubescent or glabrous; leaf blade elliptic, oblong or oblong-lanceolate, 3–7 × 1–3.5 cm; base cuneate to rounded; apex acuminate to acute, apiculate; abaxial surface scales (1–)1.5–5 × their own diameter apart, unequal, densely yellowish white-pubescent along lower half of midrib, mature leaves less hairy; adaxial surface scales absent or sparse to dense, densely or sparsely pubescent, with filiform-acicular hairs along midrib. Inflorescence terminal, umbellate, 2–6-flowered; rachis ca. 5 mm, glabrous. Pedicel 0.8–1.5 cm, sparsely scaly, pubescent or glabrous; calyx lobes 0.5–2 mm, rounded or triangular, densely scaly, densely pubescent or glabrous; corolla broadly funnelform-campanulate, 5-lobed to middle, blue to lavender, sometimes pale pinkish purple or white, 3–3.5 cm, outer surface glandular scaly or not, glabrous or pubescent at base; lobes oblong; stamens unequal, 2.5–3.5 cm, longer than corolla; filaments densely villous below; ovary 5-locular, densely scaly; style longer than corolla, glabrous or pubescent at base. Capsule cylindric; base oblique, 10–20 mm, densely scaly. Young shoots densely villous and pubescent. Petiole densely hispid and pubescent; abaxial leaf surface scales 1.5–2 × their own diameter apart, indumentum of petiole extending along midrib, adaxial leaf surface with filiform-acicular hairs on veins; corolla blue to lavender; style glabrous or pubescent at base.
Forests in valleys, forests or thickets on slopes, rocks on slopes; 1000–2100 m. Hubei, Shaanxi, Sichuan.

Cultivation: Easy to grow in sun or shade and very floriferous
Record Notes: Name checked with the Flora of China 4/22/2008

Location ID: 24659. Reported by Jason Martinez on 12/14/2011, reason: Jason only found one
5/4/2010 Mona Bourell	Jeanne reports plant died of thrips in lath house. Nan Ray had taken it home to resurrect but was unsuccessful.
2/11/2010 Olivier Thérault	1 plant not found in 0L4 during nursery inventory, 9/29/2009. Last checked 8/20/2009 by Jeanne Rich, notes: temp#RSF-30. On 1/5/2010, Jason commented that he thinks plant died in lath house. Location removed.
8/20/2009 Mona Bourell	Jeanne reports one dead in 0L4, probably lack of light/not enough water; qty reduced from 4 to 3.

Taxon Family Spelling Checked

Rhododendron auriculatum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White or cream to rose
Native Range: China
Description: Shrubs or small trees, 5–10 m tall; bark grayish; older branches glabrous; young shoots densely long glandular-setulose. Leaf buds long-conical, 3.5–5.5 cm; outer bud scales narrow, ca. 3.5 cm; apex acuminate, glabrous. Petiole stout, 18–30 mm, densely glandular; leaf blade leathery, oblong-elliptic, oblong-lanceolate to oblanceolate, 9–12 × 3–6.5 cm; base rounded or auriculate, unequal; margin cartilaginous, glandular-ciliate; apex obtuse, cuspidate; abaxial surface pale green, gland-tipped-villous, especially on midrib and main veins, also glandular; adaxial surface green, glabrous; midrib raised abaxially, grooved adaxially; lateral veins 20–22-paired, raised abaxially. Inflorescence large and loose, 7–15-flowered; rachis 20–30 mm, glandular. Pedicel 2–3 cm, densely glandular-hairy; calyx undulate, membranous, 2–4 mm, glandular; corolla funnelform, fragrant, white or cream to rose, 6(–10) cm, glandular-hairy inside, lobes 7; stamens 14–16, 2.5–3.4(–4) cm, filaments slender, glabrous; ovary ovoid, ca. 6 mm, 8-locular, densely glandular-hairy; style stout, ca. 3 cm, glandular to tip. Capsule terete, curved, distinctly ribbed, 30–40 mm. Fl. Jul–Aug, fr. Sep–Oct.
Forests, valleys, mountain slopes; 600–2000 m. N Guizhou, W Hubei, S Shaanxi, E Sichuan.

Cultivation: Because this species occurs in a more climatically continental region of China than most other species with large leaves, it is more tolerant of heat and cold extremes
Quite heat and cold tolerant, give this one plenty of space.
Record Notes: Spelling checked in GRIN , Flora of China, 4/30/2008.

Rhododendron auritum — Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pale yellow to cream
Native Range: Tibet
Description: Shrubs, evergreen, 1–3 m tall; stem and branches coppery red, with brown, smooth, flaking bark. Petiole 5–8 mm, scaly; leaf blade leathery, oblong, lanceolate or oblong-lanceolate, 2.5–6.6 × 1–2.7 cm; base obtuse or cuneate; apex acute or obtuse, mucronate; abaxial surface pale glaucous-green, scales overlapping to 0.5 × their own diameter apart, unequal, smaller scales more numerous, brown or dark brown, larger scales scattered; adaxial surface green, shiny, scaly. Inflorescence terminal or axillary, umbellate, 4–7-flowered. Pedicel 0.5–1.3 cm, densely scaly; calyx lobes 3–5 mm, rounded, ovate or oblong, reflexed, persistent in fruit, scaly abaxially, margin not ciliate; corolla tubular-campanulate, pale yellow to cream, sometimes with a slight tinge of pink on lobes, (1.8–)2–2.5 cm, outer surface scaly; stamens 10, ca. as long as corolla, filaments pubescent towards base; ovary densely scaly; style slender, as long as or longer than corolla, basal 1/3–1/2 scaly, otherwise glabrous. Capsule cylindric-ovate, 8–10 mm, densely scaly. Fl. Apr–Jun, fr. Jul–Sep.
Valleys, open stony banks, sheltered cliffs; 2100–2600 m. SE Xizang.

Rhododendron barbatum — Ericaceae !

INFO
Common Name:
Perennial Tree
Native Range: Bhutan, India, Nepal, China [Himalayas]
Description: Large shrubs or small trees, 1.5–8 m tall; old branches grayish brown, glabrous; young branches setose, rarely glabrous. Petiole 12–22 mm, sparsely blackish brown glandular-setose or glabrous; leaf blade leathery, oblong to obovate-oblong, 9.8–18 × 3.5–5.8 cm; base truncate to rounded; margin reflexed; apex acuminate; abaxial surface whitish green, midrib and base setose, other parts slightly hairy when young; adaxial surface green; midrib raised abaxially, impressed adaxially; lateral veins 17–21-paired. Inflorescence densely umbellate, 10–20-flowered; rachis ca. 5 mm, glabrous. Pedicel 0.5–1.3 cm, glabrous; calyx green flushed red, cupular; lobes 5, 7–15 mm, broadly ovate or obovate-oblong, glabrous or with base hairy; margin erose; corolla tubular-campanulate, fleshy, deep red to blood-red, 3.1–3.6 × 3–3.6 cm, with 5 deep blackish red nectar pouches at base, glabrous; lobes 5, ± rounded, ca. 1.8 × 1.6–1.8 cm, apex deeply emarginate; stamens 10, unequal, 1.3–2.1 cm, filaments white, glabrous, anthers subelliptic, purplish black, 1.6–2 mm; ovary cone-shaped, ca. 5 mm, densely short-glandular-hairy; style ca. 1.6 cm, glabrous; stigma small, reddish, ca. 1.8 mm wide. Capsule cylindric, ribs obvious, slightly curved, 20–24 mm, with vestigial glandular hairs; calyx persistent; style persistent. Fl. May–Jun, fr. Aug–Sep.

Abies forests, Rhododendron thickets; 2400–3500 m. S Xizang [Bhutan, India, Nepal, Sikkim].

INFO
Common Name:
Perennial Shrub
Flowers Yellow
Native Range: Tibet, India
Description: Shrubs, evergreen, usually epiphytic, 1.5–2.5 (–3) m tall; branchlets scaly, densely setose. Petiole 6–10 mm, scaly, setose; leaf blade thick and leathery, ovate, narrowly ovate to ovate-elliptic, 7–13 × 3–7 cm; base rounded or obtuse; margin ciliate; apex acuminate or acute; abaxial surface pale glaucous-green, scales ca. 1 × their own diameter apart, unequal, dark brown; adaxial surface green, somewhat shiny, without scales, setose on midrib and veins. Inflorescence (3–)7–10-flowered. Pedicel 1.3–2 cm, setose; calyx green; lobes (7–)10–15 mm, rounded, ovate to oblong, persisting to enclose mature capsule, scaly, margin ciliate; corolla broadly campanulate, bright yellow, sometimes spotted, ca. 3 cm, tube 15–17 mm, outer surface scaly, inner surface pilose, lobes spreading, rounded; stamens 10, filaments pubescent towards base for 1/3–1/2 of their length; ovary densely scaly; style stout, sharply bent, short, scaly at base. Capsule ovoid or ovoid-cylindric, 10–17 mm, scaly. Fl. Apr–May, fr. Jun–Jul.
Forests, scrub, rocks, sometimes epiphytic; 2000–2500 m. SE Xizang [NE India].

Cultivation: Needs excellent drainage.
Record Notes: Name checked with The Plant List on 10/4/2011 by Mona Bourell.

Taxon Family Spelling Checked

Rhododendron brachycarpum Ericaceae !

INFO Common Name:
Perennial Shrub
Native Range: Northern+central Japan
Description: Evergreen shrubs 1.5–3 m tall. Young shoots with subdense soft pale brownish pearled hairs, glabrous later. Leaves coriaceous, alternate; petiole 0.5–2 cm long, glabrous; blade narrowly oblong, oblong or narrowly elliptic, 4–13 cm long, 2–5.5 cm wide, apex obtuse and short apiculate, base rounded or shallowly cordate, upper surface glabrous, lower surface with dense short pearled tomentose hairs or glabrescent. Flower buds terminal, solitary, broadly ovoid, 2–2.5 cm long, 1–1.3 cm wide; outer scales widely ovate, glabrous or white pilose outside, with short white pilose on margin. Flowers early July to early August. Inflorescences corymbose or short racemose, with 5--18 flowers, rachis 1–2 cm long. Pedicel 1–3.5 cm long, with subdense soft crisped pilose hairs. Calyx saucer-shaped, 2–3 mm in diam., with dense soft pilose hairs, shallowly 5-lobed. Corolla white tinged with pale purple, with dark purplish blotches on upper inside, widely funnelform-campanulate, 2–2.5 cm long, 3–4 cm across, 5-lobed about 1/3 of length; tube 1.2–1.5 cm long, glabrous outside, pilose inside; lobes orbicular, ca. 1 cm long, 1–1.2 cm wide. Stamens 10, irregular, 1–2 cm long; filaments white pilose on lower 1/3 of length. Ovary ovoid, densely pilose. Style 1–1.3 cm long, glabrous. Capsule cylindric, 15–18 mm long, 5 mm wide, pilose. Seeds oblong, ca. 2 mm long, 0.7 mm wide, obtuse and membranaceous at one end, laciniately appendiculate at other end.

Taxon Family Spelling Checked

Rhododendron bureavii Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Native Range: China
Description: Shrubs, 1–4 m tall; young shoots densely rusty-red to tawny woolly-tomentose, sometimes mixed with red-glands. Petiole 10–20 mm, rust-red woolly-tomentose; leaf blade leathery, elliptic to obovate-oblong, 6–14 × 2.5–5 cm; base obtuse or subrounded; apex acute or acuminate, apiculate; abaxial surface rust-red to tawny, densely woolly, hairs branched; adaxial surface shiny, glabrous. Inflorescence racemose-umbellate, 10–20-flowered; rachis and pedicels densely rust-red woolly-tomentose, hairs branched, and with glandular hairs. Pedicel 1.5–2 cm; calyx lobes 5, 5–10 mm, oblong, pubescent and glandular on lower half outside, margin glandular-ciliate; corolla tubular-campanulate or campanulate, white flushed pink to pink, with purple dots inside, 3–4.5 cm, lobes 5; stamens 10, unequal, filaments pubescent at base; ovary ovoid, 4–5 mm, densely glandular-hairy and long-hairy, sometimes glandular only; style ca. 3 cm, similarly glandular-hairy and hairy. Capsule oblong-cylindric, 15–20 × ca. 10 mm, with vestiges of glands and hairs. Fl. May–Jun, fr. Aug–Oct.

Field observations suggest that Rhododendron bureavioides should be treated as a distinct species. It differs in having a bistrate indumentum.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Taxon Family Spelling Checked

Rhododendron bureavioides Ericaceae ?

INFO
Common Name:
Perennial Shrub
Native Range: China
Synonomy: = syn of Rhododendron bureavii Franchet
Description: Shrubs, 1–4 m tall; young shoots densely rusty-red to tawny woolly-tomentose, sometimes mixed with red-glands. Petiole 10–20 mm, rust-red woolly-tomentose; leaf blade leathery, elliptic to obovate-oblong, 6–14 × 2.5–5 cm; base obtuse or subrounded; apex acute or acuminate, apiculate; abaxial surface rust-red to tawny, densely woolly, hairs branched; adaxial surface shiny, glabrous. Inflorescence racemose-umbellate, 10–20-flowered; rachis and pedicels densely rust-red woolly-tomentose, hairs branched, and with glandular hairs. Pedicel 1.5–2 cm; calyx lobes 5, 5–10 mm, oblong, pubescent and glandular on lower half outside, margin glandular-ciliate; corolla tubular-campanulate or campanulate, white flushed pink to pink, with purple dots inside, 3–4.5 cm, lobes 5; stamens 10, unequal, filaments pubescent at base; ovary ovoid, 4–5 mm, densely glandular-hairy and long-hairy, sometimes glandular only; style ca. 3 cm, similarly glandular-hairy and hairy. Capsule oblong-cylindric, 15–20 × ca. 10 mm, with vestiges of glands and hairs. Fl. May–Jun, fr. Aug–Oct.

Field observations suggest that Rhododendron bureavioides should be treated as a distinct species. It differs in having a bistrate indumentum.

Record Notes: Name checked with IPNI, 4/1/2008. In Flora of China R. bureavioides is considered a synonym Rhododendron bureavii Franchet, however in the description: Field observations suggest that Rhododendron bureavioides should be treated as a distinct species. It differs in having a bistrate indumentum.

Rhododendron campylogynum Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Small shrubs, usually prostrate, creeping or decumbent, evergreen, 0.025–0.1(–1.8) m tall; branchlets short, sparsely scaly, otherwise glabrous or pubescent. Petiole 2–4 mm, scaly; leaf blade leathery, obovate to obovate-lanceolate, 0.7–2.5(–3) × 0.3–1.2(–1.8) cm; base tapering; margin crenulate; apex rounded, mucronate; abaxial surface often whitish or silvery, scales 1–6 × their own diameter apart, small, deciduous; adaxial surface dark green, usually shiny, scales rarely present. Inflorescence umbellate, 1–4(–5)-flowered. Pedicel ca. 5 cm, erect, up to 7 cm in fruit; calyx lobes 1–6 mm, rounded to ovate-oblong, persistent, scales usually absent; corolla broadly campanulate, fleshy, pruinose, pink to purple, 1–2(–2.3) cm; tube 7–12 mm, glabrous, inner surface sparsely pubescent; stamens (8–)10, shorter than corolla, filaments puberulous in lower 1/2 their length; ovary scaly; style thick, bent or sharply deflexed, glabrous. Capsule ovoid, 5–9 mm, scaly.

Rhododendron cephalanthum ssp. cephalanthum X

Ericaceae

INFO
Common Name:
Perennial Shrub
Native Range: China, Burma
Description: Semiprostrate or semidecumbent shrubs, often contorted, rarely erect, 0.3–0.6(–1.5) m tall; branchlets short, thick, scaly; bud scales persistent, conspicuous, linear to lanceolate. Petiole ca. 3 mm, scaly; leaf blade aromatic, oblong-elliptic or oblong-ovate, 1–3.5 × 0.5–1.6 cm; base rounded; apex obtuse or rounded, mucronate; abaxial surface scales overlapping, arranged in 2–3 tiers, unequal, pale yellow-brown or reddish brown; adaxial surface dark green, shiny, glabrous. Inflorescence 5–10-flowered. Pedicel 0.2–0.5 cm, scaly; calyx lobes 4–7 mm, oblong or ovate, persisting to enclose mature capsule, scaly, margin long-ciliate; corolla narrowly tubular, with spreading lobes, white, pink, to rose, (0.8–)1.2–1.5(–2) cm, tube 6.5–13 mm, outer surface not scaly; inner surface densely pilose; stamens 5(–8), included in corolla tube, filaments puberulous towards base; ovary 1–2 mm, densely scaly; style thick, turbinate, nearly as long as ovary. Capsule ovoid, 3–4 mm, densely scaly. Fl. May–Jul, fr. Sep–Nov.

Rhododendron championiae Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White or reddish.
Native Range: China
Synonymy: Rhododendron championiae var. ovatifolium P. C. Tam.
Description: Shrubs, 0.5–5 m tall; branches pubescent, also spreading glandular-setose. Petiole 12–17 mm, densely glandular-setose; leaf blade papery, elliptical, oblong-lanceolate or ovate, 7–17.5 × 2–5 cm; base cuneate, rarely subrounded; margin densely long setose, also with a few glandular hairs; apex acuminate; abaxial surface pubescent and setose, with more setae on midrib and lateral veins; adaxial surface sometimes bullate, sparsely short setose. Inflorescence subapical, 5–7-flowered, rachis 4–7 mm, glabrous; flower buds sticky. Pedicel ca. 2 cm, to 2.5 cm in fruit, pubescent and glandular-setose; calyx lobes narrow, to 12 mm, densely ciliate; corolla narrowly funnelform, white or reddish, 5–6(–7) cm; lobes oblong or oblong-lanceolate, 2.8–3.5 cm; stamens 10, unequal, shorter than corolla, filaments slender, pubescent below middle; ovary oblong, ca. 6 mm, densely yellowish brown setose; style longer than stamens, exserted, glabrous to sparsely pubescent near the base. Capsule cylindric, 6-grooved, slightly curved, up to 55 mm, densely gland-tipped setose and pubescent. Fl. Apr–May, fr. Jul–Nov.
Open valley forests, mountain slopes; 500–1300 m. Fujian, Guangdong, Guangxi, Hunan, Jiangxi, Zhejiang.

Record Notes: Name spelled R. championae in IPNI; as is in Flora of China which we follow, 4/30/2008.

Taxon Family Spelling Checked

Rhododendron ciliicalyx 'D. Stanton' Ericaceae ?

INFO
Common Name:
Perennial Shrub
Height: 6ft. Spread: 6ft.
Flowers White with yellow
Description: Description:
A stunning variety with elegant white blooms accented with a butter yellow throat; an unusual showy accent plant; absolutely must have well-drained, highly acidic and organic soil, use plenty of peat moss when planting
Ornamental Features:
D. Stanton Rhododendron is covered in stunning clusters of lightly-scented white trumpet-shaped flowers with buttery yellow throats at the ends of the branches in mid spring. It has dark green foliage. The glossy narrow leaves remain dark green through the winter. The fruit is not ornamentally significant. The smooth gray bark is not particularly outstanding.
Landscape Attributes:
D. Stanton Rhododendron is an open multi-stemmed evergreen shrub with an upright spreading habit of growth. Its relatively coarse texture can be used to stand it apart from other landscape plants with finer foliage.
This is a relatively low maintenance shrub, and should only be pruned after flowering to avoid removing any of the current season's flowers. It has no significant negative characteristics.
D. Stanton Rhododendron is recommended for the following landscape applications;
- General Garden Use
- Mass Planting
- Accent
Plant Characteristics:
D. Stanton Rhododendron will grow to be about 6 feet tall at maturity, with a spread of 6 feet. It tends to be a little leggy, with a typical clearance of 1 feet from the ground, and is suitable for planting under power lines. It grows at a slow rate, and under ideal conditions can be expected to live for 40 years or more

Rhododendron collettianum — Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White, Pink
Native Range: Pakistan, Afghanistan
Description: Aromatic shrubs, 1-2 m; branches yellowish brown, scaly. Leaves petiolate, petiole 4-6 mm long; lamina lanceolate to oblong, 2-6 cm long, 8-25 mm broad, coriaceous, lower surface yellowish-brown, scaly-tomentose. Flowers in clusters of 8-12; bracts scaly; margin ciliate. Calyx lobes oblong, 3-4 mm long, scaly, margin ciliate. Corolla white or pink, saucer-shaped, 1.5-2 cm long, tube hairy inside. Stamens 10, included; filaments barbed. Ovary 5-locular. Capsule scaly tomentose, oblong, c. 5 mm long.
Type: Pakistan: in Kurram Valley, 3000-4000 m, inter Shend Toi et cacumen N. Sikaram, Aitch. 344 (K).
Distribution: A plant of high altitudes from 3000 to 4000 m; endemic in Kurram and Chitral in West Pakistan and Nuristan in Afghanistan.

Rhododendron dalhousieae Ericaceae !

INFO Common Name:
Perennial Shrub
Flowers Pale yellow, sometimes with pale red stripes
Native Range: Himalayas
Description: Shrubs, often epiphytic, ca. 2 m tall; young branches scaly, otherwise glabrous or sparsely ciliate. Petiole ca. 15 mm, scaly; leaf blade thinly leathery, oblong, oblong-obovate, or oblanceolate, 9–11 × 3–4 cm; base cuneate; apex rounded; abaxial surface pale whitish green, scales glandular, reddish brown; adaxial surface glabrous; midrib raised on both surfaces. Inflorescence 2- or 3-flowered. Flowers fragrant. Pedicel ca. 1 cm, densely scaly, white pubescent; calyx lobes ca. 11 mm, oblong-elliptic, persistent in fruit, scaly at base, abaxially pubescent around the middle; corolla pale yellow, sometimes with pale red stripes, 8–10.5 cm; tube 60–75 mm, outer surface not scaly, or with a few scales only; stamens 10, filaments hairy, anthers ca. 12 mm, brown; ovary 5-locular, densely scaly; style sparsely scaly below. Capsule cylindric-spindle-shaped, ca. 45 mm, lobes keeled. Fl. Jun.
Native habitat: Forests, secondary mixed forest margins, hillsides, crevices on slopes, epiphytic or terrestrial; 1500–2600 m. S Xizang [Bangladesh, Bhutan, India, E Nepal, Sikkim].

Rhododendron decorum Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 8-15ft.
Flowers Pink, White Spring
Native Range: China: Sichuan & South Yunnan; N Vietnam
Description: shrub or small tree with fissured bark and dark leaves. Trusses of open, funnel shaped, strongly fragrant white flowers. Flowers usually have a yellowish inner centre and can be pink-tinted.

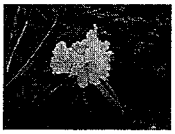

image of © 2011 Mona Bourell SFBG2008-0219

Shrubs or small trees, 1–6 m tall; young shoots greenish, glabrous. Petiole 12–40 mm, glabrous; leaf blade thickly leathery, oblong, oblong-ovate or oblong-elliptic, 5–19(–30) × 3–11 cm; base cordate or cuneate to nearly rounded; apex obtuse, rounded, apiculate; both surfaces glabrous when mature; abaxial surface pale green; adaxial surface deep green, midrib prominent abaxially, grooved adaxially; lateral veins 18-paired. Inflorescence 8–10-flowered; rachis 20–25 mm, sparsely glandular. Pedicel stout, 2.5–4 cm, glandular-hairy; calyx lobes 5, 1.5–2.5 mm, glandular-hairy; corolla funnel-campanulate, fragrant, white to pale pink, 3–10 × 5–9 cm, outer surface sparsely glandular, inner surface puberulent at base; lobes 6–8, suborbicular, ca. 2 × 2.4 cm, emarginate or entire; stamens 13–16, unequal, 2–3 cm, filaments pubescent at base; ovary cylindric, ca. 6 mm, densely glandular-hairy; style 3.4–4 cm, with similar glands to tip; stigma 2–5(–6.5) mm in diam. Capsule oblong, usually slightly curved, 25–40 × 10–15 mm. Fl. Apr–Jun, fr. Sep–Oct.
Petiole 1.7–2.3 cm; leaf blade oblong to oblong-obovate, 5–14.5 × 3–5.7 cm; corolla 3–5 cm.

Cultivation: prefers full shade to part sun; soil should be moist
Record Notes: Name checked in TROPICOS 10/18/2005.

Taxon Family Spelling Checked

Rhododendron delavayi var. delavayi Ericaceae !

INFO
Common Name:
Perennial Shrub/tree
Flowers Red May
Native Range: Himalayas, China
Synonomy: R. arboreum subsp. delavayi (Franchet) D. F. Chamberlain; R. pilovittatum I. B. Balfour & W. W. Smith.
Description: Shrubs or trees, 1–7(–12) m tall; bark grayish, exfoliating into thin and small irregular flakes; young shoots stout, white-floccose, glabrescent. Winter buds ovoid, greenish, 6–7 mm, slightly tomentose. Petiole cylindric, 7–20 mm, glabrous; leaf blade leathery, long-lanceolate, 7–15 × 1–5 cm; base tapering; margin revolute; apex obtuse or acute; abaxial surface with indumentum 1-layered, spongy or somewhat agglutinated, whitish to fawn, glabrescent; adaxial surface light or dark green, ± rugose, glabrous at maturity, midrib very prominent abaxially, deeply grooved adaxially; lateral veins 14–20-paired, slightly raised abaxially, impressed adaxially; reticulate veins evident. Inflorescence spherical, umbellate, 10–20-flowered; rachis ca. 10 mm, densely rufous-tomentose. Pedicel stout, 0.8–1 cm, densely fawn-tomentose; calyx lobes 5, ca. 2 mm, triangular; corolla campanulate, fleshy, deep crimson to carmine, 3–5 × 3–4 cm, with 5 basal nectar pouches; lobes 5, ca. 1 × 1.3 cm, apex emarginate; stamens 10, unequal, 1.6–4 cm, filaments glabrous, anthers oblong, 2–2.8 mm; ovary conoid, ca. 8 mm, 10-locular, densely fawn-tomentose; style ca. 2.8 cm, glabrous or floccose to tip, stigma capitate. Capsule oblong, 18–20 × ca. 8 mm, blackish and roughened with the remains of the rusty tomentum. Fl. May, fr. Dec.
Leaf blade oblong-lanceolate to oblong-oblanceolate, 7–15 × 1.5–5 cm; apex obtuse or acute; abaxial surface indumentum white to fawn, spongy; adaxial surface rugose. Corolla style glabrous. Fl. May, fr. Dec.
Evergreen broad-leaved forests, thickets; 1200–3200 m. NW Guangxi, W Guizhou, SW Sichuan, Yunnan [Bhutan, NE India, Myanmar, Thailand, N Vietnam].

Record Notes: Name checked with Flora of China, 4/23/2008. Plants originally received as R. arboreum subsp. delavayi, which is a synonym.

Taxon Family Spelling Checked

Rhododendron dendricola Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 10ft.
Flowers White tinged with pale red.
Native Range: India, Myanmar, China
Synonomy: R. notatum Hutchinson.
Description: Shrubs, sometimes epiphytic, 1–3.5 m tall; old branches gray, less scaly; young shoots green, thin and long, sparsely brown or brownish red scaly. Petiole 5–13 mm, sparsely scaly; leaf blade oblong-elliptic or obovate-elliptic, 7–12 × 2–4.5 cm; base narrow to rounded; apex obtuse, acute, apiculate; abaxial surface pinkish green, scales less than, or 1–4 × their own diameter apart, unequal, reddish brown; adaxial surface sparsely scaly; midrib flat raised abaxially, slightly concave adaxially; lateral veins 8-paired, thin, inconspicuous on both surfaces. Inflorescence terminal, umbellate, 2- or 3-flowered. Flowers fragrant. Pedicel ca. 1 cm, densely scaly; calyx undeveloped, circular, densely scaly; corolla broadly funnelform, white tinged with pale red, ca. 7 cm, tube gray-white-pubescent; stamens 10, unequal, half as long as corolla lobes; filaments pubescent below; ovary 6-locular, densely scaly; style as long as corolla, sparsely scaly below. Capsule cylindric-ovoid, 15–20 mm, densely brown-scaly. Fl. Apr–May, fr. May–Nov.
Mixed forests, thickets, rocks, sometimes epiphytic on trees; 1300–1900 m. SE Xizang, NW Yunnan [NE India, N Myanmar].

Cultivation: Easy to grow given excellent drainage, does well in containers
Record Notes: Name checked with The Plant List on 2/3/2014 by Mona Bourell.

Rhododendron dielsianum Ericaceae !

INFO
Common Name:
Perennial Shrub/epiphyte
Height: 4-5ft.
Native Range: New Guinea, Malaysia
Description: R. dielsianum is a Maylasian species with flowers - curved tubular - 3.5cm - up to 4 per umbel; pretty, petite, pendulous clear pink flowers 1-3/8" x 1 -1/4", the corolla tubes arcing in a graceful slope to the abruptly expanding lobes. It shares the Phaeovireya Subsection with such notables as the spectacular P. superbum, with five-inch white blossoms: the newly discovered R. magnificum, and R. konori of equally theatrical display.

R. dielsianum bloomed in March, 1974 in my greenhouse. and I was surprised to see that the style depends from the top of the flower in a downward curve, instead of ascending ventrically in an upward curve, as in any other rhododendrons I have seen. The stigma is thus presented as a miniature chandelier over the opening to the interior of the corolla. a position which would only he suited to receive pollen from the back of the pollinator. Other Vireya rhododendrons which have bloomed under glass at North Madison display no such oddity, nor does Sleumer mention it in his classic The Genus Rhododendron in Maylasia

Birds are often said to be pollinators of rhododendrons in New Guinea, but little is known on the subject. An interesting alternative is that this species may be rarely cross-pollinated. The Vireya rhododendrons are well known to produce pollen in exceptional abundance. In the case of R. dielsianum, the anthers are arrayed in a semi-circle beneath the dorsal corolla lobes so that some of them are poised directly above the stigma and the pollen pours from their apertures upon its surface. The flower is virtually certain of self-pollination, another feature of this species which is unique in my experience.

Should this species be proved to be consistently self-fertilized, its population could be expected to consist of homozygotes, each plant "pure" for the genes it possesses. There is an automatic reduction of variability from self-fertilization; the recessives disappear. Different plants of the species would each produce their own pure lines, in theory.

This premature speculation raises interesting aspects, such as the stability of the species and its

Description: Shrubs or small trees, 1.5–8 m tall; branchlets stout, glabrous. Petiole stout, 15–25 mm, glabrous; leaf blade leathery, oblong-elliptic or oblong-lanceolate, 9.5–18 × 2.4–5.4 cm, or broader; base cuneate, rarely cordate; apex obtuse; both surfaces glabrous; abaxial surface pale yellowish green; adaxial surface dark green; midrib raised abaxially, grooved adaxially; lateral veins ca. 21-paired, obscure abaxially, impressed adaxially. Inflorescence 6–8(–10)-flowered; rachis 15–30 mm, glandular. Pedicel 2–2.5 cm, glabrous or sparsely glandular; calyx lobes 7, 2–5 mm, ovate, glandular, margin gland-fringed; corolla funnel-campanulate, pale pink to white, ca. 5.5 cm, lobes 7, suborbicular, ca. 2 × 2.5 cm, emarginate; stamens 14–16, unequal, 3–3.8 cm, filaments glabrous; ovary conoid, ca. 7 mm, densely glandular-hairy; style glandular to tip. Capsule cylindric, 40–50 × ca. 15 mm. Fl. Jun–Jul, fr. Sep–Oct.
Rhododendron discolor intergrades with R. fortunei, and can reliably be separated from that species only by the proportionately narrower leaves.

Rhododendron edgeworthii Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-15ft.
Flowers White
Native Range: India, Butan, Sikkim, Myanmar, China
Synonomy: Rhododendron bullatum Franchet.
Description: Shrubs, evergreen, often epiphytic, (0.3–)1(–5.6) m tall; indumentum dark orange to pale beige-brown. Petiole 5–25 mm; leaf blade leathery, ovate-elliptic, oblong or oblong-lanceolate, 4–16 × 2–6 cm; base rounded; apex acuminate or shortly acuminate; abaxial surface densely brown or fawn, woolly, scales dense, very small, rather equal, pale brown; adaxial surface strongly bullate, glabrous. Inflorescence 1–3-flowered. Flowers fragrant. Pedicel 1–2 cm, densely woolly; calyx red or tinged red, deeply 5-lobed; lobes 11–17 mm, oblong, ovate or rounded, unequal, persisting to enclose mature capsule, scales present on margin and abaxially, also densely woolly; corolla funnelform-campanulate, white, sometimes flushed pink and/or with a yellow blotch at base, 3.4–7.5 cm; tube 25–35 mm; outer surface scaly; inner surface glabrous; stamens 10, unequal, filaments densely pilose below; ovary densely woolly, sparsely scaly; style straight, ca. as long as corolla, base scaly and woolly. Capsule cylindric-ovate or globose, 10–22 mm, scaly, densely woolly. Fl. Apr–Jun, fr. Nov.
Dense forests, cliffs, rocks, often epiphytic; 2000–4000 m. SW Sichuan, SE Xizang, Yunnan [Bhutan, N India, Myanmar, Sikkim].

Rhododendron elliottii Ericaceae !

INFO

Common Name:
Perennial Shrub
Flowers Purplish-red to bright red
Native Range: NE India
Description: Predominant Flower Color: Red
Flower / Truss Description: Funnel campanulate, purplish-red to bright red. Truss holds 10-20 flowers.
Fragrant: No
Bloom Time: Late Midseason to Late
Height (ft.) in 10 Yrs: 4
Cold Hardiness Temperature: 15°F (-9°C)
Foliage Description: Leaves oblanceolate to elliptic, up to 4½" long, both surfaces glabrous.
Elepidote

Plant Habit: Upright, often straggly shrub or small tree
Sub Genus: Hymenanthes
Section: Ponticum
Sub Section: Parishia
Geographical Origin: NE India
Cultivation: Nan Ray reports: somewhat hard to grow and/or propagate. Needs good drainage.

Rhododendron emarginatum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Golden
Native Range: China
Description: In Section Vireya of Subgenus Rhododendron.
Many-branched shrubs, sometimes epiphytic, 1–1.5 m tall; internodes short; young shoots papillate, scaly; bud scales soon deciduous. Petiole 2–5 mm, scaly; leaf blade leathery, oblong-obovate, oblanceolate or spathulate, 1.5–3.5 × 0.8–1.5 cm; base cuneate; margin revolute; apex broadly rounded, emarginate, apiculate; abaxial surface pale yellowish green, scales 2–3(–5) × their own diameter apart, concave; adaxial surface deep green, glabrous; midrib and lateral veins raised abaxially, concave adaxially; lateral veins 3- or 4-paired. Inflorescence terminal, 1-flowered. Pedicel 1.4–2.3 cm, scaly; base subtended by several bracts; calyx lobes shallow and undulate, sparsely scaly; corolla campanulate, golden, 1.3–1.5 cm, outer surface scaly; stamens 10, unequal, as long as or shorter than corolla; filaments pubescent in lower 2/3; ovary 5-locular, densely scaly, glabrous; style erect or arching, shorter than corolla, longer than stamens. Capsule narrowly cylindric, 10–13 mm, glandular scaly. Fl. Oct–Jan.

Epiphytic on trees, rocks; 1200–2000 m. Guangxi, Guizhou, SE Yunnan.

Cultivation: Hardier than most Vireyas.
Record Notes: Name checked with Flora of China on 10/5/2011 by Mona Bourell.
In Section Vireya of Subgenus Rhododendron.

Taxon Family Spelling Checked

Rhododendron euonymifolium -short form Ericaceae ?

INFO
Common Name:
Perennial Shrub
Native Range: China & N. Vietnam
Description: Multi-branched shrubs, sometimes epiphytic, ca. 0.5 m tall; young shoots papillate, scaly; bud scales soon deciduous. Petiole 2–6 mm, scaly; leaf blade leathery, obovate or obovate-spathulate, 1.2–2.5 × 0.8–1.3 cm; base cuneate; apex rounded, sometimes retuse; abaxial surface pale yellowish green, scales 4–6 × their own diameter apart; lateral veins inconspicuous on both surfaces. Inflorescence terminal, 1-flowered. Pedicel 0.5–1 cm, scaly; calyx lobes conspicuous, 1–2 mm, scales present, sparse; corolla campanulate, golden, 0.8–1 cm; tube ca. 3 mm; outer surface sparsely scaly; mouth hairy; lobes 0.6–0.7 cm; stamens 10, unequal; filaments hairy around the middle, glabrous below; ovary scaly, pubescent; style straight, shorter than corolla and stamens. Capsule narrowly cylindric, ca. 10 mm. Fl. Aug–Sep.
Mountain thickets; 1200–2100 m. Guangxi, Yunnan [N Vietnam].
Rhododendron emarginatum var. eriocarpum, described from Guangxi and Yunnan, is synonymous with R. poilanei, described from N Vietnam. These two taxa share a hairy ovary with R. euonymifolium, which could, if also synonymous, be the earliest name for the species (H. Léveillé, Repert. Spec. Nov. Regni Veg. 12: 103. 1913). One of the syntypes of the latter species, Esquirol 661 (E), is very poor but has ovaries, all of which are hairy. However, there is some confusion, as the other, rather more complete syntype, J. Cavalerie 264 (E), has both hairy and hairless ovaries. This is the crucial character separating R. poilanei from the more or less sympatric R. emarginatum. It appears that designation of a lectotype is required.

Rhododendron excellens Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White
Native Range: South China - North Vietnam
Description: Species in subsection Maddenii. Large and vigorous evergreen shrubs with smooth peeling, reddish-brown bark. The leaves of this species are rather similar to those of its close relative – R. nuttallii, differing in its scales and leaf color. The spectacular, large and funnel-shaped, fragrant flowers (early to mid-summer) are white with a yellow or greenish throat. This species has been introduced quite often from many different locations in the past several years and there is some confusion as to the identity of many of these collections as some forms of this species seem to be close to R. nuttallii which grows in the same area. Most forms are quite distinct however, and this is proving to be a fantastic new plant for mild climates or container. Native to S Yunnan, Guizhou and adjacent N Vietnam where it occurs as an epiphyte and on rocks and cliffs in montane forests from around 6,500 to 8,000 ft.
Cultivation: Sun-part shade, hardy to 15 deg.
Record Notes: Name checked with The Plant List on 5/14/2014 by Mona Bourell.

Taxon Family Spelling Checked

Rhododendron floribundum Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs or small trees, 2–10 m tall; branchlets stout, ca. 5 mm in diam., pubescent when young, glabrescent. Petiole cylindric, 10–15 mm; leaf blade leathery, elliptic-lanceolate or oblanceolate, 8–13 × 1.8–3.8 cm; base cuneate or rounded; apex acute; abaxial surface with indumentum 2-layered, upper layer loosely woolly, yellowish at first, becoming white or grayish, persistent, hairs stellate; lower layer appressed and pale gray-white; adaxial surface green, bullate, glabrous; midrib prominent abaxially, depressed adaxially; lateral veins 17–20-paired, prominent abaxially, depressed adaxially. Inflorescence 8–12-flowered; rachis 5–7 mm. Pedicel 1.5–2 cm, yellowish or whitish tomentose; calyx lobes 5, ca. 1.5 mm, narrowly triangular, acute, floccose; corolla broadly campanulate, at first magenta-rose, becoming paler pink, with crimson flecks and blotch at base within, 3.5–4 cm, lobes 5, orbicular, 1–1.5 × 1.5–2 cm, emarginate; stamens 10, unequal, 2–3.5 cm, filaments glabrous; ovary oblong, ca. 5 mm, silky-hairy; style 3.5–4 cm, longer than corolla, glabrous, stigma dilated. Capsule cylindric, 20–30 mm, yellowish, with gray pubescence. Fl. Apr–May, fr. Jul–Aug.

Rhododendron griersonianum Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: Myanmar, China: Yunnan
Description: Description from Flora of China
Shrubs, ca. 1.3 m tall; bark rough, branches straight, ca. 4 mm in diam. below inflorescence; young shoots glandular-setulose and woolly-tomentose. Petiole purple, 10–25 mm, glandular-setulose and tomentose; leaf blade leathery, narrowly elliptic, or lanceolate, 7.5–14 × 2–3.5 cm; base obtuse; margin revolute; apex acute or acuminate; abaxial surface densely whitish or pale brown woolly-tomentose, midrib glandular and tomentose; adaxial surface dull green, glabrous or glabrescent at maturity, midrib glandular-setose towards base; midrib raised abaxially, grooved adaxially; lateral veins 12–18-paired. Inflorescence 5–12-flowered; rachis 10–30 mm, densely tomentose and glandular-setulose. Pedicel 1.5–3 cm, tomentose, glandular-setulose; calyx 2–3 mm, tomentose and glandular; corolla tubular, funnelform or funnel-campanulate, deep rose-crimson to scarlet, 5–7 cm, inner surface puberulent, outer surface densely hairy; lobes 5; stamens 10, 2.8–3.5 cm, filaments puberulent in lower two-thirds; ovary conoid, ca. 6 mm, densely dendroid-hairy, glandular; style glandular at base. Capsule cylindric, ca. 23 × 8–9 mm, persistently tomentose. Fl. May–Jun, fr. Mar of next year.

Mixed forests, thickets; 1600–2700 m. W Yunnan [Myanmar].

Rhododendron hippophaeoides Ericaceae !

INFO Common Name:
Perennial Shrub
Height: 2ft.
Flowers Lavender, pink
Native Range: China: Yunnan, Sichuan
Description: Erect shrubs, 0.25–1(–1.5) m tall; branchlets virgate; bud scales deciduous. Petiole 2–5 mm, scaly; leaf blade oblong, elliptic, oblong-lanceolate to oblong-ovate, (0.8–)1.2–2.5(–4) × (0.4–)0.5–1(–1.7) cm; base broadly cuneate; apex rounded or obtuse; abaxial surface yellowish buff, scales overlapping, uniformly creamy yellow; adaxial surface pale green, scaly. Inflorescence 4–7(–8)-flowered. Pedicel 2.5–7 cm; calyx reddish, lobes 1–2 mm, rounded, unequal, persistent in fruit, scaly, margin ciliate; corolla broadly funnelform, bright rose or lavender-blue to bluish purple, rarely white, 1–1.3(–1.5) cm, tube ca. 4 mm, outer surface not scaly; inner surface pubescent; stamens (8–)10, shorter than corolla, filaments pubescent towards base; ovary 1–2.5 mm, scaly; style 0.4–1.6 cm, usually as long as stamens, glabrous or occasionally pubescent at base. Capsule narrowly ovoid, 5–6 mm, densely scaly. Fl. May–Jun, fr. Oct.
Style 4–10.5 mm; leaves broad and large; inflorescence few-flowered.
Native habitat: Picea and Pinus forests, Rhododendron thickets, moist stony pastures, open grassy marshes, open stony slopes; 2400–4800 m. SW Sichuan, C, N, and W Yunnan.

Cultivation: Hardy to -20°F (-29°C)
likes moist soils.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron hyperythrum Ericaceae !

INFO

Common Name:
Perennial Shrub
Height: 6ft. Spread: 6ft.
Flowers White, Pink Spring
Native Range: Northern Taiwan
Synonomy: Rhododendron rubropunctatum Hayata
Not Invasive
Description: This species tends to form a compact and rounded plant, reaching 6 feet in height and diameter at maturity. In mid-May in the Boston area it produces an abundance of white, open funnel-form flowers up to 2 inches in length in trusses of 5 to 12 blooms. Occasionally the flowers are spotted with purple. R. hyperythrum seems quite hardy, taking -15°F, a surprising cold tolerance given the species' origins in the subtropical lower slopes of the mountains of Northern Taiwan. This elepidote (unscaly) rhododendron is a member of the hardy subsection Pontica, but it seems only distantly allied to the other members of the subsection (such as R. brachycarpum, catawbiense, maximum, smirnowii and yakushimanum). The specific epithet 'hyperythrum' means 'reddish below' and refers to the reddish pits, which dot the underside of the leaves. This distinguishing characteristic is less noticeable to the casual observer than the unmistakable recurved, shiny dark green leaves. These leathery 5-6 inches long, narrow leaves have their edges rolled sharply under; their undersides are pale green and glabrous (hairless). Interestingly, the plants in the wild usually have flat leaves and only those in cultivation display the unusual curled edges. The leaf petioles (stems) are bright yellow turning reddish brown near the stem (the same color as the flower buds in winter). R. hyperythrum's distinctive, curled foliage offers an excellent contrast with the flat, larger leaves of many of our favorite plants and with the indumented foliage of R. yakushimanum, smirnowii and bureavii. It is a free-flowering, lovely white bloomer. It is surprising that this plant is seen so rarely in cultivation in this country and that so few nurseries and catalogs offer it. The only reliable source seems to be the chapter's Van Veen order, where it is offered most years. Little hybridizing has been done with it, except for a substantial breeding program by John Thornton in Louisiana (see ARS Journal Vol. 44 #2 1990) and a few other southern hybridizers interested in its tolerance to

Rhododendron impeditum Ericaceae !

INFO

Common Name:
Perennial Shrub
Native Range: China: Sichuan, Yunnan
Description: Small, much-branched, compact shrubs, usually forming cushions, 0.8(–1.2) m tall. Petiole 1–3 mm, scaly; leaf blade ovate, elliptic or broadly elliptic to oblong, (0.4–)0.5–1.4(–1.6) × (0.25–)0.3–0.6(–0.8) cm; base broadly cuneate; apex acute or obtuse, mucronulate; abaxial surface pale gray-green, scales markedly to slightly spaced, usually uniformly rusty or amber; shiny; adaxial surface dark green, sparsely scaly, pale. Inflorescence (2–)3- or 4-flowered. Pedicel 1–3 cm, scaly; calyx lobes 2.5–4 mm, oblong, persistent in fruit, scales present, forming a sparse central band, ciliate; corolla broadly funnelform, purple, violet or rose-lavender, rarely white, (0.7–)0.8–1.5 cm, tube (2–)3–6 mm, outer surface usually sparsely scaly, rarely also pubescent, inner surface pubescent; stamens (5–) 10 (or 11), filaments pubescent towards base; ovary 1.5–2.5 mm, scaly; style very variable, longer or shorter than stamens, glabrous or puberulous at base. Capsule ovoid, 4–6 mm, densely scaly. Fl. May–Jun, fr. Sep–Oct.

Mixed thickets, Rhododendron thickets, alpine meadows, open slopes; 2500–4600 m. SW Sichuan, NW Yunnan.

Rhododendron japonicum — Ericaceae !

INFO

Common Name: Japanese azalea
Perennial Shrub
Native Range: Japan
Synonomy: Azalea japonica
Description: Deciduous shrubs 1–2 m tall. Branchlets long hirsute when young, glabrous later. Leaves chartaceous, alternate, crowded near apex of branchlets; petiole 3–10 mm long, sparsely long hirsute; blade oblanceolate or oblong-oblanceolate, 5–9 cm long, 1.5–2 cm wide, apex obtuse or subacute and terminating into a gland, base cuneate, attenuate into petiole, glabrous on both surfaces, except midrib sparsely long hirsute on lower surface, ciliate and minutely pilose on margin, lower surface pale green or pale green tinged with glaucous. Flower buds terminal, solitary, ellipsoid, ca. 10 mm long, 8 mm wide, each with 3–8 flowers; outer scales orbiculate-ovate, glabrous outside, with dense white pilose hairs on margin. Flowers mid May to mid June, 3–8, terminal, in umbel-like arrangement, opening leaves. Pedicel 0.6–3 cm long, with subdense white pubescent, mixed with sparse long ciliate hairs. Calyx saucer-shaped, 4–5 mm in diam., with subdense short pubescent hairs, 5-lobed; lobes lanceolate, 1–2 mm long, 0.8 mm wide, obtuse, glabrous or sparsely short pubescent outside, long-ciliate on margin. Corolla red or orange red, with dark reddish blotches on inside above, openly funnelform-campanulate, 5–6 cm long, 6 cm across, deeply 5-lobed; tube slender lower, dilated above, 2–2.5 cm long, sparsely pilose on both surfaces; lobes oblong, 3--3.5 cm long, 1.7–2.8 cm wide. Stamens 5, subequal, 3--3.5 cm long; filaments pilose on lower-half; anthers oblong, ca. 3 mm long. Ovary narrowly ovoid, densely hirsute. Style 5–6 cm long, pilose on lower 1/3 of length. Capsule broadly cylindrical, more or less arched, 2–2.5 cm long, 0.8–1 cm wide, pubescent, mixed with long hirsute hairs. Seeds compressed, ellipsoid, body ca. 2.5–3 mm long, 1–1.5 mm wide, mostly encircled by a wing.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=23718 useage as 'accepted'. 2004-07-19.

Rhododendron kawakamii Ericaceae !

INFO
Common Name:
Perennial Shrub/epiphyte
Flowers white to pale red or yellow
Native Range: Taiwan
Description: Multi-branched shrubs, epiphytic, 0.3–1.5 m tall; young shoots slender, long, twisted, glandular-scaly. Petiole 2–8 mm, sparsely scaly; leaf blade leathery, oblong-obovate to obovate or oblanceolate, 2–5 × 1–3 cm; base cuneate; margin slightly revolute; apex rounded, apiculate; abaxial surface yellowish green, scales 2–3 × their own diameter apart, small, unequal, glandular, brown; adaxial surface dark or fresh green, scaly or not, midrib and lateral veins raised abaxially, concave adaxially. Inflorescence terminal, umbellate, 3–6-flowered. Pedicel 0.2–0.25 cm, sparsely glandular-scaly; calyx lobes 5, 1–2 mm, ovate or triangular, scaly abaxially and on margin; corolla campanulate, white to pale red or yellow, 1–1.5 cm, outer surface glandular-scaly; lobes broadly ovate; stamens 10, unequal, 0.6–0.7 cm, shorter than corolla; filaments densely pubescent in lower 2/3; ovary 5-locular, scaly, densely pubescent; style stout, erect or arched, shorter than corolla, as long as or slightly longer than stamens, often glabrous, sometimes with lower part pubescent. Capsule tubular or subovoid, 8–12 mm, densely pubescent or sparsely villous.

Thickets, sometimes epiphytic on trees; 800–2600 m. Taiwan.
2 Varieties:
Corolla white to red; leaf blade obovate to oblong-obovate; petiole 2–8 mm. var. kawakamii
Corolla yellow; leaf blade oblanceolate; petiole short. var. flaviflorum

Named after Takiya Kawakami, a collector from Japan 1871-1915

Record Notes: Name checked with Tropicos & FOC on 1/23/2012 by Mona Bourell.
In section Vireya of Subgenus Rhododendron.

Taxon Family Spelling Checked

Rhododendron keiskei Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: Japan
Description: Much branched evergreen shrubs 1–2 m tall. Young branchlets rough brownish lepidote. Leaves thin coriaceous, alternate, scattered on sterile branches, crowded near apex of fertile branches; petiole 3–10 mm long, densely lepidote; blade oblong or oblong-lanceolate, apex acuminate and terminating into a gland, base acute, 3–9 cm long 1–2 cm wide, upper surface sparsely lepidote, minutely puberulent along midrib, lower surface pale green, rough lepidote. Flower buds terminal, single, oblong-ovoid, acute, ca. 7 mm long, 4 mm wide, outer scales orbiculate-ovate, white pilose on margin, deciduous at flowering. Flowers early April to early May. Inflorescences corymbose, with 2–4 flowers, rachis 2–3 mm long. Pedicel 0.8–1 cm long at flowering, 1–1.5 cm long at fruiting, brownish lepidote. Calyx saucer-shaped, ca. 2.5 mm in diam., irregularly and shallowly lobed on margin. Corolla yellow with pale greenish blotches at upper inside, funnel-shaped, ca. 2 cm long, 3 cm wide, sparsely lepidote outside, dissected about 1/2 of corolla length into 5 lobes; lobes orbiculate-ovate 1–1.5 cm long, 0.8–1.2 cm wide. Stamens 10, irregular, as long as or slightly longer than corolla; filaments 17–25 mm long, densely white-lanate on lower half; anthers ellipsoid, ca. 2 mm long. Ovary oblong-lanceolate, densely lepidote. Style slightly curved, 2.5–3.5 cm long, longer than corolla, glabrous. Capsule cylindrical, straight, 10–13 mm long, 2–3 mm wide, densely lepidote. Seeds oblong, ca. 1 mm long, 0.4 mm wide, with a short appendage on one side.

Taxon Family Spelling Checked

Rhododendron kendrickii Ericaceae !

INFO
Common Name:
Perennial shrub/tree
Flowers Deep rose to scarlet with flecks.
Synonomy: R. pankimense Cowan & Kingdon Ward, R. shepherdii Nuttall.
Description: Small trees or shrubs, 1–3 m tall; older branches glabrous; young shoots stout, slightly floccose. Petiole cylindric, 10–15 mm, glabrescent; leaf blade subleathery, narrowly elliptic to lanceolate, 7–11 × 2–4 cm; base cuneate to rounded; margin revolute undulate; apex acuminate; abaxial surface woolly on midrib, otherwise glabrous; adaxial surface glabrous when mature; midrib prominent abaxially; lateral veins 17–24-paired, slightly raised abaxially, impressed adaxially. Inflorescence densely racemose-umbellate, 7–15-flowered; rachis 10–15 mm, densely tomentose. Pedicel 0.3–1 cm, puberulent; calyx discoid; lobes 5, minute, triangular, glabrous; corolla tubular-campanulate, fleshy, deep rose to scarlet, with dark flecks, 3–3.5 cm, with 5 nectar pouches at base, both surfaces glabrous, lobes ca. 1 cm, emarginate; stamens 10, unequal, 1.5–2.2 cm, filaments glabrous; ovary cylindric-conoid, ca. 7 mm, sparsely strigose, eglandular; style ca. 2 cm, glabrous; stigma small. Capsule slightly curved, 15–25 × ca. 4 mm. Fl. Apr–May, fr. Aug–Oct.

Thickets, mixed forests on slopes; 2600–2700 m. E Xizang [Bhutan, NE India].

Record Notes: Name checked with the Flora of China, 4/29/2008.

Taxon Family Spelling Checked

Rhododendron kiusianum 'Harunoumi' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 2-4ft.
Flowers Pinks, purples
Description: Dense, twiggy, dwarf, semi-evergreen shrub that is native to the mountaintops of Kyushu Island, Japan. R. kiusianum has also been known as R. indicum amoenum and R. obtusum f. japonicum. Hardy to 0 degrees F. Leaves are small, obovate, dark green, 1/4 to 3/4 inch long. Flowers are small, held in trusses of 2 to 3 per cluster, and borne from mid to late spring. Best adapted to full sun. Beautiful planted in containers, rock gardens and in drifts at the front of a shrub border. Prune immediately after flowering so you won't cut off any of next year's flower buds. Best if not sheared. Plant as you would any of the other azaleas: high and in well-drained, acidic soil, rich with organic matter. Though azaleas have a potentially large list of possible pest and disease problems, they are usually trouble free if planted correctly in proper cultural conditions.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 12/15/2009.
Kyushu Azalea

Rhododendron laetum Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft. Spread: 4ft.
Flowers Orange
Native Range: New Guinea
Description: The plant shown is from a seed-grown plant which was grown by Pete Sullivan at Strybing Nursery in the 1960's. This was one of the first vireyas introduced for horticulture and is often used in hybridizing. It has wonderfully colored salmon-yellow flowers with darker orange edges. This species can become a 4' by 4' shrub and bloom heavily several times a year. Like a lot of vireyas, this one likes to get tall and leggy at first and then branch and fill in as it ages.
Record Notes: In Section Vireya of Subgenus Rhododendron.
Spelling checked in IPNI, 2/8/2008.

Rhododendron lasiostylum — Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Small multi-branched shrubs, 1–2 m tall; young shoots densely brown or gray-brown strigose, hairs flattened. Summer and winter leaves different. Petiole 3–9 mm, densely coarsely strigose, hairs flat; leaf blade papery, oblong-oblanceolate or obovate, 3–4.5 × 2–3 cm; base cuneate; margin entire; apex obtuse to acute; both surfaces densely coarsely red-brown strigose, hairs flattened. Inflorescence 2–4-flowered. Pedicel 0.5–0.9 cm, densely coarsely brown strigose; calyx lobes elliptic-oblong, 2–3 × ca. 1 mm; outer surface sparsely pubescent; margin ciliate; corolla funnelform, pink, 1.5–2 cm; lobes unequal, oblong, ca. 1 cm, apex obtuse to rounded; stamens 10, unequal, partly exserted, filaments flat, with fine papillose hairs below; ovary ovate-conical, ca. 2 mm, densely coarsely brown strigose; style ca. 1.4 cm, with pale brown hairs at base. Capsules long-cylindric-ovoid, ca. 8 × 2.5 mm, densely strigose. Fl. Jun.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron lenschianum Ericaceae ?

INFO Common Name:

ACCESSION **SFBG# 2004-0567 DEACCESSIONED** Rec'd: 7/23/2003
Source: Unknown, possibly Bian Tan
Orig. Qty: 1
Material: unknown

Notes

5/17/2005 David Kruse-Pickler: Plant died in bed 0G3, Jeanne Rich, none left. Deaccessioned.

1/4/2005 Geoff Smick: Nomenclature dubious, see species record for more info.

7/8/2004 Tony Morosco: Found one plant in nursery bed 0B1 during cleanup. White label reads "Rhododendron lenschianum Ran BT" earliest date on label is 7/23/03. No unambiguous matches in Bian Tan Field Notes, though there are several Rhododendron sp. listed.

Rhododendron lepidostylum Ericaceae !

INFO Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs, evergreen, 0.3–1.5 m tall; young growth scaly, densely long-setose; bud scales persistent. Petiole 4–12 mm, scaly, long-setose; leaf blade leathery, obovate, oblong-obovate to ovate, (2–)3–4(–4.5) × (1–)1.5–1.8(–2) cm; base rounded; margin revolute, long-setose; apex rounded, mucronate; abaxial surface glaucous, scales 1–4 × their own diameter apart, usually unequal, golden, midrib setose; adaxial surface bluish green, glabrous. Inflorescence 1–2(–3)-flowered. Pedicel 2–3 cm, scaly, long-setose; calyx lobes 1–7 mm, lanceolate to ovate, persistent in fruit, scaly, long-setose, margin long-setose; corolla funnelform-campanulate, yellow, sometimes with orange spots, 2–3.3 cm; tube 10–12 mm; outer surface scaly, long-setose; stamens 10, filaments pubescent towards base; ovary scaly, setose; style slender, straight, usually longer than corolla. Capsule cylindric, ca. 10 mm, scaly, long setose. Fl. May–Jun, fr. Jul–Aug.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron leptocladon Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Yellow
Native Range: Vietnam, China: Yunnan
Synonymy: Rhododendron nemorosum R. C. Fang.
Description: Shrubs, epiphytic, 0.5–1 m tall; young shoots densely brown-scaly, otherwise glabrous. Petiole 5–7 mm, densely brown-scaly, glabrous; leaf blade leathery, elliptic, oblong-elliptic or ovate, 4–6(–8) × 2–3.5 cm; base cuneate to rounded; apex acute, apiculate; abaxial surface gray green, scales contiguous, or less than their own diameter apart, unequal, brown, without hairs; adaxial surface green, glabrous; midrib raised abaxially, concave adaxially; lateral veins 6-paired, slightly concave above and raised below, or inconspicuous on both surfaces. Inflorescence terminal, umbellate, 3- or 4-flowered. Pedicel stout, 0.3–0.4 cm, densely scaly; calyx 5-lobed; lobes 1–2 mm, ovate, apex rounded, densely scaly abaxially; corolla broadly funnelform, lobed to the middle, yellow, 3.5–4.3 cm, outer surface sparsely scaly, tube gray-white-pubescent, lobes 5, ovate; stamens 10, unequal, shorter than corolla; filaments densely spreading pubescent at base, anthers brown, ca. 5 mm; ovary densely scaly; style slightly longer than corolla, basal part scaly. Capsule ovoid-cylindric, 5-lobed, ca. 11 mm, densely scaly.
Forests, often epiphytic on trees; 2000–2300 m. S Yunnan [N Vietnam].

Rhododendron leptothrium Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: Burma+china
Description: Shrubs or small trees, 3–4(–6) m tall; young shoots densely white-pubescent. Petiole 10–18 mm, densely pubescent or sparsely glandular-hairy; leaf blade subleathery, lanceolate or oblong-lanceolate, 4–12 × 1.8–3.5 cm; base cuneate; margin shallowly undulate, slightly revolute, tapering toward truncate apex; adaxial surface pubescent only on midrib; midrib and lateral veins prominent on both surfaces. Inflorescences subapical, usually in clusters of 2–4, 1-flowered. Pedicel 1.5–2.5 cm, densely shortly glandular-setose; calyx lobes large, elliptic or oblong-ovate, 6–8 mm, glandular hairy at base on outer surface; margin glabrous or glandular-ciliate, apex obtuse; corolla rotate, pale rose to magenta-purple, with dark flecks on upper lobes, tube shorter than lobes; lobes obovate, 2–2.5 cm; stamens 5, unequal, shorter than corolla, filaments flat, pubescent below the middle; ovary ovoid, ca. 3 mm, apex glandular hairy; style ca. 2.2 cm, longer than stamens, exserted, glabrous. Capsule ovoid, ca. 6 mm, glandular and glandular-setose, surrounded by persistent calyx lobes. Fl. May–Jun, fr. Sep–Nov.

Rhododendron lindleyi Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 4-9ft.
Flowers White
Native Range: Bhutan, India, Myanmar, Nepal, Sikkim, Tibet
Synonymy: Rhododendron bhotanicum C. B. Clarke.
Description: Shrubs, often epiphytic, 1.5–3 m tall; sparsely branched; young shoots scaly. Petiole convex, 15–20 mm, scaly; leaf blade thinly leathery, ovate-lanceolate, or narrowly elliptic, 6–15 × 1.5–5.5 cm; base cuneate or rounded; apex rounded; abaxial surface pale white, scales 2–3 × their own diameter apart, variable in size; adaxial surface deep green, sparsely scaly. Inflorescence terminal, umbellate, 4–6-flowered. Pedicel 1–1.5 cm, densely brownish red scaly; calyx lobes 1–5 mm, oblong, persistent and surrounding base of fruit, scaly at base; corolla broadly tubular-campanulate, white, 7–8 cm, outer surface scaly at base; stamens 10, filaments pubescent below; ovary 5-locular, densely reddish brown scaly; style base scaly. Capsule ca. 50 mm, not keeled. Fl. Apr–May.
Forests, sometimes epiphytic; 1600–2900 m. Xizang [Bangladesh, Bhutan, N India, Myanmar, Nepal, Sikkim].

Rhododendron macabeanum Ericaceae !

INFO

Common Name: Rhododendron
Perennial Tree
Height: 15-20ft.
Flowers White, Yellow March - April
Native Range: Himalayas
Description: Very large trusses of creamy yellow flowers with lovely blotches inside the bell-shaped petals. They contrast with the large deep green leaves. A majestic plant growing to 15 or 20ft. It flowers in March to April.

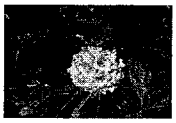

image of 4/1/ M.Lewis

A large leaf Rhododendron
Cultivation: These plants need a shady spot with a well-aerated, slightly acid and well-drained soil that does not dry out. Mulch lightly each spring to conserve soil moisture and protect from heavy frosts. Avoid planting in positions with strong or persistent winds which will scorch or tear the leaves.

image of 4/1/ M.Lewis

Eventually a tree R. macabeanum can become quite tall and leggy when grown in shade, or wider and more shrub-like in a more open position. For those with a cooler climate and a largish-space in the garden R. macabeanum is a magnificent plant with its salmon pink new shoots and huge sculpted leaves. The creamy flowers in the early spring and are well worth waiting a year or two while your plant matures.
Record Notes: Name checked in IPNI 11/28/2005.

Taxon Family Spelling Checked

Rhododendron macrophyllum Ericaceae !

INFO

Common Name: California Rosebay, Coast rhododendron, Pacific rhododendron
Perennial Tree
Native Range: Western North America
Description: Shrubs or trees, to 5 m, sometimes rhizomatous. Stems: bark smooth to vertically furrowed, shredding; twigs with basally branched, crisped/matted, eglandular hairs, very quickly glabrate. Leaves persistent; petiole glabrous; blade elliptic to slightly ovate or obovate, (6-)8.5-14(-20) × 2.5-5.5(-7.5) cm, thick, coriaceous, margins entire, plane to revolute, glabrous, apex acute to obtuse or slightly acuminate, surfaces scattered eglandular-hairy (hairs branched basally, crisped, very quickly deciduous), abaxial surface ± smooth. Floral bud scales multicellular eglandular-hairy (hairs branched basally), and unicellular-hairy (hairs short to elongate) abaxially, margins eglandular-hairy (hairs branched). Inflorescences 10-20-flowered; bracts similar to bud scales. Pedicels 30-60 mm, glabrous. Flowers opening after development of leaves (of flowering shoots), erect to horizontal, fragrant; calyx lobes 1-1.5 mm, glabrous, except margins eglandular- and stipitate-glandular-hairy; corolla white to pink or rose-purple, with yellowish green spots on upper lobe, broadly campanulate, 24-48 mm, outer surface glabrous, petals connate, lobes 14 -30 mm, tube gradually expanding into lobes, 10-23 mm; stamens 10, included, ± unequal, 16-37 mm. Capsules borne on erect pedicels, 13-25 × 4-7 mm, eglandular-hairy (hairs ferruginous, branched or unbranched) and, often, stipitate-glandular-hairy. Seeds without distinct tails, flattened portion of testa well developed at each end; testa expanded, dorsiventrally flattened, loose. 2n = 26.

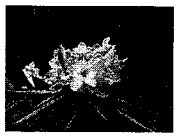

image of © 2007 David W. Kruse-Pickler SFBG

image of © 2007 David W. Kruse-Pickler SFBG

Flowering spring-summer. Forest and forest margins, thickets; 50-1600 m; B.C.; Calif., Oreg., Wash.

Rhododendron macrophyllum, R. maximum, and R. catawbiense represent subg. Hymenanthes (Blume) K. Koch in North America; the subgenus is represented by hundreds of species in temperate eastern Asia and is characterized by its branched, eglandular hairs (D. F. Chamberlain 1982). These showy plants are frequently used as ornamentals.

Taxon Family Spelling Checked

Rhododendron maddenii ssp. crassum Ericaceae !

INFO

Common Name:
Perennial Shrub
Flowers White, Yellow Jan, May, Jun, Apr
Native Range: China
Synonymy: Rhododendron crassum Franch., Rhododendron chapaense Dop;

Rhododendron odoriferum Hutch. ,

Rhododendron manipurense Balf. f. & G. Watt
Description: From Flora of China:
Shrubs or small trees, 3–6 m tall; branches many; young shoots brownish scaly. Petiole grooved, 5–10 mm; Leaf blade elliptic to elliptic-lanceolate, (4–)5.5–8 cm wide.; base cuneate; apex acute or obtuse; abaxial surface scales dense, reddish brown; adaxial surface scales present in young leaves, glabrescent. Inflorescence 3–5-flowered. Flowers fragrant. Pedicel 1.3–1.5 cm; calyx lobes 3–5 mm, orbicular or oblong, scaly; corolla funnelform, white, (3.5–)6–8.5(–10) cm; tube (20–)30–50(–60) mm; outer surface scaly; stamens 15–25, filaments pubescent; ovary 10–12-locular; style exserted, upper 1/3 with scales; stigma large, discoid. Capsule ellipsoid, 20–35 × 12–15 mm.Fr. Aug.
Native habitat: Dry secondary forests, Tsuga-Rhododendron thickets, shrubby slopes; (1500–)2600–3200 m. S Xizang, N and W Yunnan [N India (Manipur), NE Myanmar, Thailand, N Vietnam].

Highly variable species. Leaves elliptic, glossy, medium to dark green. Tubular funnel-shaped, white, very fragrant. Trusses have 3-10 flowers. Late to Very Late bloomer (although often blooms in Janurary at SFBG). Cold hardy to 20°F (-7°C).
Cultivation: It is hardy to 10deg, although probably best planted in a sheltered spot. Sun or part shade.
Record Notes: Spelling checked in GRIN database 12-17 -2005.
Name updated from Rhododendron crassum (nom. nud.) to Rhododendron Rhododendron maddenii subsp. crassum (Franch.) Cullen, per synonymy link in TROPICOS database 1/26/2006. Often sold under synonyms: Rhododendron crassum, Rhododendron manipurense

Rhododendron maddenii ssp. maddenii Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White
Synonomy: Rhododendron brachysiphon I. B. Balfour ex Hutchinson
Rhododendron brevitubum I. B. Balfour & R. E. Cooper [not J. J. Smith (1914)]
Rhododendron calophyllum Nuttall
Rhododendron jenkinsii Nuttall
Rhododendron macranthum Griffith [not (Bunge) D. Don (1834)]
Rhododendron maddenii var. longiflorum W. Watson
Rhododendron polyandrum Hutchinson.
Description: Shrubs or small trees, 3–6 m tall; branches many; young shoots brownish scaly. Petiole grooved, 5–10 mm; leaf blade leathery, lanceolate,oblanceolate, or elliptic, 5–15(–18) × 2–4 cm; base cuneate; apex acute or obtuse; abaxial surface scales dense, reddish brown; adaxial surface scales present in young leaves, glabrescent. Inflorescence 3–5-flowered. Flowers fragrant. Pedicel 1.3–1.5 cm; calyx lobes 3–5 mm, orbicular or oblong, scaly; corolla funnelform, white, (3.5–)6–8.5(–10) cm; tube (20–)30–50(–60) mm; outer surface scaly; stamens 15–25, filaments usually glabrous ; ovary 10–12-locular; style exserted, upper 1/3 with scales; stigma large, discoid. Capsule ovoid, 10–20 × 10 mm

Native distribution: Forests, scrub, river valleys; ca. 2600 m. S Tibet, Bhutan, NE India, Sikkim

Record Notes: Name checked with the Flora of China, 1/8/2009.

Rhododendron magnificum Ericaceae !

INFO
Common Name:
Perennial Tree
Flowers Rosey purple
Native Range: Myanmar, Tibet
Description: Trees, 13–18 m tall; branchlets stout, glabrous. Petiole stout, slightly flattened, narrowly winged, 30–35 mm, sparsely gray-tomentose, glabrescent; leaf blade leathery, broadly obovate to oblong-ovate, widest above middle, 20–32 × 10–14 cm; base cuneate with broad wings decurrent down petiole; apex rounded, shortly apiculate; abaxial surface gray-white, with a thin loose 2-layered indumentum, upper layer arachnoid, tending to disappear in older leaves, lower layer compacted; adaxial surface slightly rugulose, glabrous; midrib and veins prominent abaxially. Inflorescence racemose-umbellate, ca. 30-flowered; rachis ca. 30 mm. Pedicel 1–1.5 cm, densely rufous-pubescent; calyx lobes 8, ca. 1 mm; corolla campanulate or funnelform-campanulate, rosy-purple, unspotted, 5–6 × ca. 5 cm, with darker nectar pouches, puberulent at base inside, lobes 8; stamens 16, unequal, filaments glabrous; ovary ca. 7 × 4 mm, 16–20-locular, densely rufous-tomentose; style red, longer than stamens, glabrous, stigma discoid. Fl. Feb–Mar.
Rainy forests or thickets along stream banks; 1800–2400 m. SE Xizang (Myanmar border) [NE Myanmar].

Record Notes: Spelling checked in GRIN, Flora of China, 4/30/2008.

Rhododendron makinoi Ericaceae !

INFO Common Name:
Perennial Shrub
Native Range: Japan
Description: Evergreen shrubs 1.5--2 m tall. Leaves coriaceous, alternate, crowded at apex of branchlets; petiole 0.5--1.5 cm long, villous; blade linear, 10--17 cm long, 1--2 cm wide, margin entire, revolute, apex acute, base narrowing, attenuate into petiole, upper surface glabrous, lower surface with dense fuscous tree hairs. Flower buds terminal, solitary, ovoid-globose; outer scales orbiculate, aristate and mucronate, with dense villous hairs outside. Flowers early to mid May. Inflorescences corymbose, with 5--10 flowers, rachis 6--10 mm long. Pedicel 1.5--2.5 cm long, brownish villous. Calyx saucer-shaped, ca. 4 mm in diam., villous, shallowly 5-lobed, lobes widely deltoid, obtuse. Corolla purple, with dark blotches on upper inside, funnelform-campanulate, 3--4 cm long, 4--4.5 cm across, 5-lobed 1/3 of length, tube 2--2.5 cm long, glabrous outside, sparsely pilose inside; lobes semiorbiculate, 1--1.5 cm long, 1.5--2 cm wide. Stamens 10, irregular, 1.5--3 cm long; filaments densely pilose near base; anthers oblong, ca. 3 mm long. Ovary ellipsoid-ovoid, villous. Styles 2.5--3 cm long, glabrous. Capsule oblong or ellipsoid-oblong, 10--15 mm long, 8 mm across, villous. Seeds ellipsoid, ca. 1.2 mm long, 0.8 mm wide, acute at one end, laciniately appendiculate at other end.

Rhododendron maximum Ericaceae !

INFO
Common Name: rosebay
Perennial Shrub/tree
Height: 5 - 33ft.
Flowers White to pink, rarely deep pink to purple, with yellowish green spots on upper lobe
Native Range: E North America
Synonomy: Rhododendron ashleyi Coker

Description: Sub Genus: Hymenanthes
Section: Ponticum
Sub Section: Pontica

Shrubs or trees, to 10 m, sometimes rhizomatous. Stems: bark smooth to vertically furrowed, shredding; twigs multicellular stipitate-glandular-hairy and eglandular-hairy (hairs basally branched, crisped/matted), glabrate in age. Leaves persistent; petiole multicellular-hairy (hairs ± branched), often glabrescent; blade oblong to obovate or elliptic, (6-)9-20(-31) × (1.5-)2-5(-8) cm (length/width ratio 2.4-8), thick, coriaceous, margins entire, revolute to ± plane, glabrous or sparsely hairy (hairs branched), apex acuminate to sometimes acute, surfaces scattered stipitate-glandular-hairy and eglandular-hairy (hairs forming dense mat, basally branched, crisped, abaxially becoming sticky and matted, forming ± scaly or continuous, pale, shellaclike coating, smooth to slightly roughened, hairs ± deciduous adaxially). Floral bud scales stipitate-glandular-hairy, eglandular-hairy (hairs ferruginous, crisped), and short unicellular-hairy abaxially, margins hairy (hairs branched, long-celled). Inflorescences 10 -25-flowered; bracts similar to bud scales. Pedicels 17 -60 mm, multicellular stipitate-glandular-hairy. Flowers opening after development of leaves (of flowering shoots), erect to horizontal, not or only slightly fragrant; calyx lobes 2-6 mm, stipitate-glandular-hairy; corolla white to pink, rarely deep pink to purple, with yellowish green spots on upper lobe, campanulate, 20-36 mm, scattered stipitate-glandular-hairy on outer surface, petals connate, lobes 10-23 mm, tube gradually expanding into lobes, 7-16 mm; stamens 10, included, ± unequal, 14-26 mm; (ovary stipitate-glandular-hairy). Capsules borne on erect pedicels, 8-20 × 4-6.5 mm, stipitate-glandular-hairy. Seeds without distinct tails, flattened portion of testa well developed at each end;

Perennial Shrub
Native Range: Burma+china+tibet
Description: Dwarf shrubs, evergreen, sometimes epiphytic, (0.05–) 0.3–0.6(–0.8) m tall; branchlets setose. Petiole 3–6 mm, scaly, setose; leaf blade leathery, elliptic, elliptic-obovate to broadly elliptic, (1.5–)3–4 × (1–)1.5–2 cm; base rounded; margin revolute, usually setose; apex obtuse, mucronate; abaxial surface whitish papillose, scales 0.5–1 × their own diameter apart, varying in size, brown, bladderlike, sunk in pits; adaxial surface dark green, shiny, glabrous except for a few bristles at base of midrib. Inflorescence 1–2(–3)-flowered. Pedicel ca. 1 cm, scaly, setose; calyx lobes 6–10 mm, obovate to rounded, persisting to enclose mature capsule, scaly, ciliate; corolla broadly campanulate, yellow or rarely white, rarely with purple spots, (1.6–)2–2.5 cm, tube (8–)10–12 mm, scaly; stamens 10, shorter than corolla, filaments pubescent towards base or to 2/3 of their length; ovary scaly; style stout, sharply bent, short, sparsely scaly at base. Capsule ovoid to cylindric-ovoid, 8–11 mm, scaly. Fl. Apr–Jun, fr. Jul–Sep.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron metternichii — Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 13ft.
Flowers Rose-colored
Native Range: Japan
Description: Large evergreen shrub to 4 m. high, with thick terete branches rusty-tomentose while young; leaves coriaceous, oblanceolate, 8-20 cm. long, 2.5-5 cm. wide, acute at both ends, deep green, lustrous, entire, with slightly recurved margins, densely rusty-tomentose beneath, the petioles 1-2 cm. long; inflorescence many-flowered, sessile, the bracts and bud-scales deciduous, the pedicels 2-5 cm. long, rusty-pubescent while young; corolla infundibuliform, 4-5 cm. across, 7-lobed, rose-colored, glabrous, stamens 14, the filaments white granular-pubescent on the lower half; ovary densely rusty-villous; styles glabrous, 3-3.5 cm. long; capsules ovoid-cylindric, 15-25 mm. long, 7-8 mm. in diameter, with persistent brown hairs.

Rhododendron molle Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: Eastern+central China
Description: Shrubs, 0.5–2 m tall; branches densely gray-white-pubescent, also sparsely setose when young. Petiole 2–6 mm, puberulent and ± setose; leaf blade papery, oblong to oblong-lanceolate, 5–11 × 1.5–3.5 cm; base cuneate; margin ciliate; apex obtuse and mucronate; abaxial surface densely gray-white-pubescent, yellow-brown setose along midrib; adaxial surface sparsely to densely puberulent when young. Inflorescence terminal, racemose-umbellate: flowers opening before or with the leaves; many-flowered. Pedicel 1–2.5 cm, pubescent and sparsely setose; calyx lobes small, rounded, pubescent and setose-ciliate; corolla broadly funnelform, yellow or golden yellow, with dark red flecks on lobes, ca. 4.5 × 5–6 cm; tube cylindric, tapering towards base, ca. 26 mm wide, outer surface puberulent; lobes 5, elliptic or ovate-oblong, ca. 2.8 cm, puberulent on outer surface; stamens 5, unequal; filaments flat, puberulent below; ovary conical, ca. 4 mm, densely gray-white-pubescent, also sparsely setose; style to 6 cm, glabrous. Capsule conical-cylindric, 5-ribbed, 25–35 mm, puberulent and sparsely setose. Fl. Mar–May, fr. Jul–Aug.

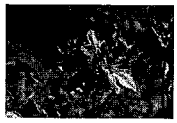

image of 4/1/ M.Lewis

Kron (Edinburgh J. Bot. 50: 279. 1993) treated Rhododendron japonicum A. Gray as R. molle subsp. japonicum (A. Gray) Kron. This taxon differs from subsp. molle in its more densely hairy fruit and yellow to orange-red flowers. It is restricted to Japan.

Rhododendron montroseanum Ericaceae !

INFO
Common Name: Rhododendron
Perennial shrub-tree
Flowers pink March
Native Range: Southeastern Tibet
Synonomy: Rhododendron mollyanum Cowan & Davidian
Description: #

Trees 12–15 m tall; shoots stout, ca. 12 mm in diam., thinly gray-tomentose. Petiole stout, 20–40 mm, silvery-gray arachnoid-tomentose or glabrescent; leaf blade thickly leathery, oblanceolate to oblong, 20–30 × 5.5–10 cm; base rounded or broadly cuneate; apex rounded and mucronate; abaxial surface indumentum silvery-white, thin, compacted; adaxial surface glabrous; midrib and lateral veins prominent abaxially. Inflorescence racemose-umbellate, 15–20-flowered; rachis ca. 30 mm, floccose. Pedicel 3–5 cm, densely tawny-tomentose; calyx teeth 8, ca. 1 mm, minute, tomentose; corolla ventricose-campanulate, pink with crimson blotch at base, ca, 5 cm, lobes 8, emarginate; stamens 16, unequal, filaments glabrous; ovary 8–9 mm, densely rufous-tomentose; style slightly shorter than corolla, but longer than stamens, glabrous; stigma discoid.

Open montane forests; 2800–2900 m. S Xizang.

Record Notes: Name found with IPNI search, 6/15/2006. R. mollyanum found to be a synonym in Flora of China http://www.efloras.org/florataxon.aspx?flora_id=2&taxon_id=242344185

Rhododendron montroseanum 'Brodick' Ericaceae ?

INFO
Common Name:
Description: sinogrande +5°F 6' March. Pale-yellow to white flowers with a crimson blotch. Very large (to 30"), heavily-textured leaves with indumentum below. (Grandia)
'BRODICK' A selected form from the UK.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: This cultivar name has not been found with an internet search to be associated with the species R. montroseanum.
From Sonoma Horticultural Nursery Rhododendron species list, the following are species for which 'Brodick' is listed as cultivar:
- R. sinogrande +5°F 6' March. Pale-yellow to white flowers with a crimson blotch. Very large (to 30"), heavily-textured leaves with indumentum below. (Grandia)
'BRODICK' A selected form from the UK.
- R. houlstonii 'BRODICK' -5°F 5' Late March-April. Funnel-shaped, lavender-pink flowers tinged pink. Upright, open grower. Closely allied to R. fortunei ssp. discolor. (Fortunea)
- R. fortunei ssp. discolor +5°F 6' Early April. Fragrant pink flowers. Very large, matte-green leaves. Vigorous, upright habit. See also R. houlstonii 'BRODICK'. (Fortunea)

Rhododendron moulmainense Ericaceae !

INFO
Common Name:
Perennial Shrub/tree
Native Range: China, India, Indonesia, Malaysia, Myanmar, Thailand
Synonomy: R. klossii Ridley, R. leucobotrys Ridley, R. nematocalyx I. B. Balfour & W. W. Smith [?], R. oxyphyllum Franchet, R. pectinatum , R. siamense Diels, R. stenaulum I. B. Balfour & W. W. Smith.
Description: Shrubs or small trees, 3–15 m tall; bark gray-brown, not peeling. Petioles stout, 10–15 mm, glabrous; leaf blade leathery, oblong-lanceolate or elliptic-lanceolate, 5–12 × 2.5–5 cm; base cuneate or broadly cuneate; margin revolute; apex acuminate to acute; both surfaces glabrous; lateral veins not reaching margin. Inflorescence subapical, 2- or 3-flowered. Pedicel 1–2 cm, glabrous; calyx lobes 5, shallowly undulate, small, glabrous; corolla narrowly funnelform, white, with a yellow blotch within, 4.3–5.5 cm, tube 15–20 × 3–4 mm in diam., lobes deeply divided, spreading, oblong-obovate, apex entire and rounded; stamens 10, unequal, 3.5–4 cm, slightly shorter than corolla, filaments flat, with silvery-white scurfy pubescence below middle; ovary long-cylindric, tapering into style, 5–10 mm, dark brown, glabrous; style ca. 5 cm, often shorter than corolla, slightly longer than stamens, glabrous. Capsule cylindric, apex acuminate, 35–60 × 4–6 mm; style persistent. Fl. Mar–Apr, fr. Jul–Dec.
Open forests, thickets; 700–1500 m. S Yunnan [NE India, Indonesia, Malaysia, Myanmar, Thailand].

Rhododendron nematocalyx is said to differ in its larger calyx. However, calyx size is in general extremely variable in this section; it is therefore uncertain whether this entity should be treated as a straight synonym of R. moulmainense or maintained as a variety of it.

Rhododendron neriiflorum var. neriiflorum Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 9ft.
Flowers Red Apr, May
Native Range: Bhutan, India, Myanmar, China
Synonomy: Rhododendron euchaites I. B. Balfour & Forrest
Rhododendron neriiflorum subsp. euchaites (I. B. Balfour & Forrest) Tagg
Rhododendron neriiflorum subsp. phoenicodum (I. B. Balfour & Farrer) Tagg
Rhododendron neriiflorum var. euchaites (I. B. Balfour & Forrest) Davidian
Rhododendron phoenicodum I. B. Balfour & Farrer.
Description: Shrubs 1–3 m tall; bark gray-brown, usually falling off in flakes; young shoots 3–4 mm in diam. below inflorescence, whitish tomentose, glabrescent. Petiole purple, 10–15 mm, glabrous when mature or glandular; Leaf blade smooth abaxially, without marked reticulations, oblong to obovate, 4–11 × 1.5–3.5 cm; base obtuse; apex obtuse or rounded, apiculate; abaxial surface glaucous, glabrous, epidermis papillate, sometimes markedly so and with strong reticulations; adaxial surface green, smooth, glabrous; midrib prominent abaxially, grooved adaxially; lateral veins 15–17-paired. Inflorescence umbellate, 5–12-flowered; rachis ca. 10 mm, tomentose. Pedicel 1–1.5 cm, sparsely stellate-tomentose; calyx fleshy when well-developed; lobes 5, 4–10 mm, glabrous; corolla tubular-campanulate, fleshy, crimson or bright red, 3–4.5 cm, with 5 dark crimson basal nectar pouches; lobes 5, rounded, ca. 1.5 cm, emarginate; stamens 10, unequal, 1.8–2.9 cm, filaments purple, glabrous; ovary conoid, tapering into style ca. 7 mm, densely tomentose, glandular, rarely glabrous; style glabrous. Capsule cylindric, ca. 22 × 5 mm, with remnants of indumentum. Fl. Apr–May, fr. Sep–Oct.
Mixed forests, Pinus forests, Rhododendron forests, bamboo forests; 2100–3600 m. SE Xizang, W Yunnan [Bhutan, NE India, Myanmar].

Rhododendron nuttallii Ericaceae !

INFO
Common Name:
Perennial Tree
Native Range: Bhutan, India, Vietnam, Tibet
Description: Small trees, to 10 m tall, or epiphytic, with thick roots, to 4 m tall; old branches glabrous; young shoots dark, densely scaly. Petiole convex, ca. 20 mm, sparsely scaly; leaf blade leathery, elliptic, 12–20 × 6–10 cm; base rounded; apex rounded; abaxial surface scales dense, small, unequal, brownish red; adaxial surface scales dense when young, glabrescent; midrib raised on both surfaces; lateral veins 12–16-paired. Inflorescence terminal, 5(–11)-flowered. Pedicel pendulous, ca. 3 cm; calyx lobes 15–25 mm, oblong-elliptic; apex rounded, scales present, dense; corolla white tinged with yellow on tube and with lobes tinged pale red, (7.5–)10(–12.5) cm; tube (45–)70–80 mm, outer surface scaly at base; lobes rounded, shorter than tube; stamens 10, as long as corolla tube, filaments pubescent, anthers reddish brown, ca. 8 mm; ovary 5-locular; style curved upwards; base densely scaly; stigma large, discoid. Capsule 30–35 mm, scaly, lobes keeled. Fl. Apr–May.
Rhododendron thickets, epiphytic or terrestrial; ca. 2400 m. SE Xizang [N India, N Vietnam].

Record Notes: Spelling checked in GRIN, Flora of China, 4/30/2008.

Taxon Family Spelling Checked

Rhododendron occidentale 'SM Form' Ericaceae !

INFO
Common Name:
Perennial Shrub
Record Notes: Plants received as "Smith-Mossman Forms" of the Western Azalea. About Frank Mossman & Britt Smith: Britt Smith, now a retired Boeing airplane designer, and his good friend, Dr. Frank Mossman of Vancouver, WA, collected and documented cuttings of the very fragrant, abundantly-flowered Western Azalea in the wilds of northern California and southern Oregon. They collected and propagated cuttings for breeding material for use in hybridizing experiments, which they planted in their own gardens. In 1997, the Smiths decided to sell their Kent East Hill acreage, and the azaleas' fate was in question. Fortunately, an agreement to help the buyer and developer with the wetland restoration of the property in exchange for the azalea collection for the arboretum was developed and the Azalea garden was born.

10/3/2006 Mona Bourell — Jeanne & Mona found 1 in 0A2 during inventory 9/21/2006

1/20/2005 Geoff Smick — may be part of accession # 2005-0059, but pot labels poorly written , not too sure what is going on with all of those rhodys!

Rhododendron occidentale 'Graciosa' Ericaceae

INFO

Common Name: Graciosa Western Azalea
Perennial Shrub
Flowers Orange, Yellow May
Description: Tall, upright, deciduous shrub that is cold hardy down to -12 degrees F. Leaves are elliptic to oblong, glossy, medium green, 1 1/4 to 3 1/2 inches long. Leaf undersides are glaucous. Flowers are borne in large, showy trusses in mid-spring just after the leaves emerge. The deciduous azalea is known for superb fall color and unsurpassed spring flowers.
Cultivation: It is usually less picky about soil conditions, though it too prefers well-drained and acid conditions. Though azaleas have a potentially large list of possible pest and disease problems, they are usually trouble free if planted correctly in proper cultural conditions.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name not found on the American Rhododendron Society website, IPNI, or Tropicos. Google search does not look good either. AK 3/12/07.
Originally in record as Rhododendrn 'Graciosa'; this cultivar name was found [internet search] to be a cultivar of R. occidentale, M. Bourell, 3/13/2007.

Rhododendron occidentale 'Rogue River Belle' Ericaceae

INFO

Common Name:
Perennial Shrub
Height: 8-10ft.
Flowers White, Pink, Yellow
Description: Cultivar: Rogue River Belle

Plant Category: landscape, shrubs,
Plant Characteristics: low maintenance,
Foliage Characteristics: medium leaves, deciduous,
Foliage Color: green,
Flower Characteristics: fragrant, long lasting, showy, single,
Flower Color: pinks, whites, yellows,

Cultivation: Tolerances: deer, seashore, slope,
Requirements
Flowering Time Range: Early Spring to Late Spring
USDA Hardiness Zone: 7 to 9
AHS Heat Zone: Not defined for this plant
Light Range: Part Sun to Full Sun
pH Range: 4.5 to 6.5
Soil Range: Sandy Loam to Clay Loam
Water Range: Normal to Moist
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 6/3/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon Family Spelling Checked

Rhododendron ovatum Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs, 2–4(–6) m tall; young shoots sparsely glandular-hairy and pubescent. Petiole ca. 8 mm, narrowly winged, pubescent; leaf blade ovate to oblong-elliptic, 3.5–5 × 1.9–2.5 cm; base rounded or rarely broadly cuneate; margin slightly curved; apex acute and mucronate; adaxial surface glabrous or pubescent; lateral and net veins inconspicuous abaxially. Inflorescence subapical, 1-flowered. Pedicel 0.8–1.8 cm, densely gray-brown pubescent, also with short glandular hairs; calyx deeply lobed; lobes ovate or oblong-ovate, 4–5 × 3–4 mm, densely gray-brown pubescent, also sparsely glandular hairy at base abaxially, margin glabrous; corolla rotate, purplish, purple, or pink, with purple flecks inside tube, 1.6–2.3 cm, outer surface glabrous, inner surface puberulent; lobes oblong-obovate or broadly obovate; stamens 5, unequal, 1.5–2.1 cm, slightly shorter than corolla, filaments flat, pubescent in lower half; ovary ovoid, with dense short glandular hairs; style ca. 2.4 cm, exserted, glabrous. Capsule broadly ovoid, ca. 8 × 6 mm, densely gray-brown pubescent, also sparsely glandular. Fl. Apr–May, fr. Jul–Oct.

Gao Lianming (pers. comm.) notes that recent field studies have shown that the differences used to separate var. setuliferum from the type of the species, namely the narrower leaf blade and the style with dense bristles near the base, are not even borne out by the type of this variety, and in any case these features vary continuously between the two varieties.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Taxon Family Spelling Checked

Rhododendron pachypodum Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Native Range: China: Yunnan
Description: Shrubs, rarely small trees, rarely epiphytic, 1–4(–5) m tall; young shoots densely brown-scaly, otherwise glabrous. Petiole 6–16 mm, densely scaly, sometimes long-villous; leaf blade leathery, elliptic, elliptic-lanceolate or obovate, 6–11 × 2–5 cm; base narrower; apex acuminate or acute; abaxial surface gray white, scales less than 1 × their own diameter apart to nearly contiguous, sometimes 1 × their own diameter apart, brown or brownish red; adaxial surface sparsely scaly; midrib and lateral veins raised abaxially, concave adaxially; lateral veins thin. Inflorescence terminal, umbellate, (2–)3(–4)-flowered. Pedicel 0.5–1 cm, densely scaly; calyx undeveloped, 5-lobed; lobes ca. 1 mm, rounded or triangular, persistent in fruit, scaly; corolla broadly funnelform, white tinged with pale red, inside with pale yellow markings, 5–7 cm, densely scaly, tube gray-white-pubescent outside; stamens 10, unequal, long ones half as long as corolla lobes; filaments pubescent below; ovary (5 or)6-locular, densely scaly; style rarely longer than corolla, basal part scaly. Capsule ovoid or cylindric-ovoid, 15–25 mm. Fl. Mar–May.

Cullen (Notes Roy. Bot. Gard. Edinburgh 39: 47, 53. 1980) maintained Rhododendron rufosquamosum as a species distinct from R. pachypodum.

Rhododendron pemakoense Ericaceae !

INFO

Common Name:
Perennial Shrub
Height: 1ft.
Flowers Pink
Native Range: Tibet, India
Description: Predominate Flower Color: Pink
Flower / Truss Description: Tubular funnel shaped, pink to pale purplish-mauve. Inflorescence 1-2 flowered.
Bloom Time: Early to Early Midseason
Height (ft.) in 10 Yrs: 1
Cold Hardiness Temperature: 0°F (-18°C)
Foliage Description:
Leaves oblanceolate or obovate, up to 1 1/8" long, lower surface glaucous.
Plant Habit: Dense, mounding, often stoloniferous shrub
Sub Genus: Rhododendron
Section: Rhododendron
Sub Section: Uniflora
Geographical Origin:
China (SE Tibet), India (Arunachal Pradesh)

Record Notes: Spelling checked in GRIN , IPNI, American Rhododendron Society, 4/7/2008.

Taxon Family Spelling Checked

Rhododendron phaeochrysum Ericaceae !

INFO

Common Name: Rhododendron
Perennial Shrub
Native Range: China
Description: Shrubs, 1–4.5 m tall; shoots white-floccose, glabrescent. Petiole 10–15 mm, floccose, soon glabrescent; leaf blade leathery, oblong-elliptic to ovate-oblong, 5–14 × 2–5.5 cm; base subrounded or subcordate; apex acute to mucronate; abaxial surface tawny to golden-brown or cinnamon, densely tawny to golden-brown or cinnamon agglutinated or felted tomentose, hairs branched; adaxial surface glabrous. Inflorescence racemose-umbellate, 8–15-flowered; rachis 10–15 mm. Pedicel 1–1.5 cm, sparsely floccose or glabrous; calyx lobes 5, ca. 1 mm, acute, glabrous; corolla funnel-campanulate, white to pale pink, with purplish red spots, 2–4.5 cm, lobes 5, orbicular; stamens 10, unequal, filaments pubescent in lower part; ovary ca. 7 mm, glabrous or sparsely pubescent; style ca. 2.4 cm, glabrous. Capsule oblong-cylindric, straight, slightly curved at apex, 15–30 × 4–6 mm. Fl. May–Jun, fr. Jul–Oct.

Leaf blade 7–14 cm; abaxial surface densely tawny to golden-brown, ± agglutinated, felted-tomentose, not splitting.

Hybrids probably account for part of the wide variation shown by Rhododendron phaeochrysum, which extensively hybridizes with both R. agganiphum and R. przewalskii (see above) and possibly some other species.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron phaeopeplum Ericaceae ?

INFO
Common Name:
Perennial Epiphyte/terrestrial
Flowers White
Native Range: New Guinea
Synonomy: possibly R. konori var. phaeopeplum
Description: From Vireya Rhododendron site: http://www.vireya.net/gallery-spK.htm
Section Phaeovireya
Height - 2m - epiphytic or terrestrial
Leaves - broadly elliptic - 10 x 5cm - scaly
Flowers - funnel-shaped - 9cm - up to 6 per umbel - scented
Location - Indonesia: W.New Guinea: Wissel Lakes region & Arfak Mts. - 1300m
Epithet - sp. after Konor, a Papuan deity; var."with a dark covering", alluding to the leaf scales.
Smaller in all parts than var. konori.

Rhododendron konori var. phaeopeplum
Section Phaeovireya
Height - 2m - epiphytic or terrestrial
Leaves - broadly elliptic - 10 x 5cm - scaly
Flowers - funnel-shaped - 9cm - up to 6 per umbel - scented
Location - Indonesia: W.New Guinea: Wissel Lakes region & Arfak Mts. - 1300m
Epithet - sp. after Konor, a Papuan deity; var."with a dark covering", alluding to the leaf scales.
Smaller in all parts than var. konori.

Record Notes: In section Vireya of Subgenus Rhododendron.. Name checked with The Plant List on 4/9/2012 by Mona Bourell: This name is unresolved. The record derives from WCSP (in review), name for which the contributing data sources did not contain sufficient evidence to decide whether they were Accepted or Synonyms. It may be a var. of R. konori which is also listed as "unresolved".

Taxon Family Spelling Checked

Rhododendron poilanei 'tall form' Ericaceae !

INFO

Common Name:
Perennial Shrub
Height: 3ft.
Flowers Pale Orange/Golden Aug, Sept
Native Range: China, Vietnam
Synonymy: Rhododendron euonymifolium H. Léveillé
Description: Multi-branched shrubs, sometimes epiphytic, ca. 0.5 m tall; young shoots papillate, scaly; bud scales soon deciduous. Petiole 2–6 mm, scaly; leaf blade leathery, obovate or obovate-spathulate, 1.2–2.5 × 0.8–1.3 cm; base cuneate; apex rounded, sometimes retuse; abaxial surface pale yellowish green, scales 4–6 × their own diameter apart; lateral veins inconspicuous on both surfaces. Inflorescence terminal, 1-flowered. Pedicel 0.5–1 cm, scaly; calyx lobes conspicuous, 1–2 mm, scales present, sparse; corolla campanulate, golden, 0.8–1 cm; tube ca. 3 mm; outer surface sparsely scaly; mouth hairy; lobes 0.6–0.7 cm; stamens 10, unequal; filaments hairy around the middle, glabrous below; ovary scaly, pubescent; style straight, shorter than corolla and stamens. Capsule narrowly cylindric, ca. 10 mm. Fl. Aug–Sep.
Mountain thickets; 1200–2100 m. Guangxi, Yunnan [N Vietnam].

Rhododendron emarginatum var. eriocarpum, described from Guangxi and Yunnan, is synonymous with R. poilanei, described from N Vietnam. These two taxa share a hairy ovary with R. euonymifolium, which could, if also synonymous, be the earliest name for the species (H. Léveillé, Repert. Spec. Nov. Regni Veg. 12: 103. 1913). One of the syntypes of the latter species, Esquirol 661 (E), is very poor but has ovaries, all of which are hairy. However, there is some confusion, as the other, rather more complete syntype, J. Cavalerie 264 (E), has both hairy and hairless ovaries. This is the crucial character separating R. poilanei from the more or less sympatric R. emarginatum. It appears that designation of a lectotype is required.

Record Notes: Originally received as Rhododendron

Rhododendron ponticum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Lilac-pink to purple spotted with greenish yellow/orange May, Jun
Native Range: Southern Europe & SW Asia
Description: Flower
Campanulate, pale to deep lilac-pink to purple, usually spotted greenish yellow. Truss holds 6-20 flowers. Not fragrant:

Foliage Description:
Leaves lanceolate to elliptic, up to 7½" long, glabrous.
Plant Habit:
Dense to leggy shrub
Sub Genus:
Hymenanthes
Section:
Ponticum
Sub Section:
Pontica
Geographical Origin:
N Turkey, Georgia, Armenia, Lebanon, Europe (Spain, Portugal, Bulgaria)

Cultivation: Cold Hardiness Temperature: -5°F (-21°C)
Record Notes: Spelling checked IPNI, 6/1/2009.

Rhododendron protistum Ericaceae !

INFO

Common Name:
Perennial Tree
Flowers Rose to Crimson-purple late winter or early spring
Native Range: Tibet, Myanmar, China
Description: Trees, 5–10 m tall; shoots stout, ca. 1 cm in diam., yellow-gray-tomentose. Petiole stout, terete, 25–40 mm, glabrous; leaf blade thickly leathery, oblong-lanceolate to oblong-oblanceolate, 12–45 × 5–20 cm; base cuneate; apex obtuse, mucronate; abaxial surface appressed pale brown tomentose, sometimes restricted to a marginal band at maturity; adaxial surface glabrous, sometimes with vestiges of hairs; midrib stout, conspicuously elevated abaxially. Inflorescence racemose-umbellate, 20–30-flowered; rachis ca. 60 mm. Pedicel stout, 1.5–2 cm, densely tawny-tomentose; calyx lobes 8, 2–3 mm, unequal, triangular, tomentose; corolla funnelform-campanulate, creamy-white, rose or deep purple-red, with dark basal blotch, 5–8 cm, nectar pouches present; lobes 8; stamens 16, unequal, filaments glabrous; ovary 9–11 mm, densely tawny fasciculate-tomentose; style ca. 4 cm, glabrous; stigma large and discoid-lobulate. Capsule cylindric, ca. 40 × 12 mm, tomentose. Fl. Mar–May, fr. Aug–Nov.

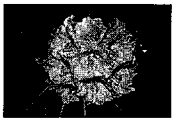

image of 2/1/ S. Pellaton

Leaf blade 20–45 cm; abaxial surface with tomentum restricted to a marginal band at maturity; flowers 5–5.5 cm, creamy-white tinged rose.

Cultivation: Protect from severe wind and cold and you will be rewarded with rose to crimson-purple flowers one late winter or early spring. Grown from wild collected seed.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

SFBG# 2004-0264 DEACCESSIONED Rec'd:
Source: Unknown, via Bian Tan #94
Orig. Qty: ?
Material: unknown
Wild Collected by Bian Tan 94; Unknown- does not appear in field notes..
Flower color Orange

Notes

1/30/2007 Tony Morosco: Location record for Conservatory of Flowers Bed Number 125B removed, since it is no longer jointly managed with SFBG. This was only location noted, so deaccessioned record.

1/4/2005 Geoff Smick: No R. quadras in IPNI, likely R. quadrasianum instead.

3/22/2004 Tony Morosco: Accessioned from white pot labels "Rh. quadras 94 BT" no other info. Not in BT field notes.

Rhododendron quadrasianum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pale Orange
Native Range: Philippines
Description: Section Discovireya
Height - 3m - mostly terrestrial
Leaves - obovate - 3.0 x 1.3cm
Flowers - tubular - 1.8cm - usually solitary or in pairs
Location - Philippines: Luzon: Mayon Volcano; Mindoro: Mt. Isarog - 1330-2100m
Epithet - after J. F. Quadras, a friend of Vidal who collected in the Philippines.

Record Notes: In section Vireya of Subgenus Rhododendron.

Taxon Family Spelling Checked

Rhododendron racemosum Ericaceae !

INFO

Common Name:
Perennial Shrub
Flowers White to pink mid spring
Native Range: China
Description: Small, much-branched shrubs, 0.15–2 m tall; young branches short and slender, brown glandular scaly, otherwise glabrous or somewhat velutinous. Petiole short, 2–4 mm, scaly; leaf blade fragrant, oblong to elliptic, 1.5–4 × 0.8–1.8 cm; base cuneate or rounded; margin revolute; apex obtuse or acuminate, apiculate or not; abaxial surface usually gray-white, scales less than 1 × their own diameter apart, not contiguous, medium sized, brown; adaxial surface densely brown scaly. Inflorescence axillary or subterminal, 2- or 3-flowered; bud scales many, imbricate, persistent until flowering time. Pedicel slender, 0.5–1 cm, densely scaly; calyx discoid, slightly serrulate, minute, scaly; corolla widely funnelform, divided from below or at middle, pink or purple, 0.9–1.4 cm, outer surface sparsely scaly, lobes spreading; stamens 10, exserted, filaments pilose at base; ovary 5-locular, densely scaly; style longer than stamens, glabrous or shortly pilose at base. Capsule cylindric, 5–10 mm, scaly. Fl. Mar–May.
Rhododendron ×fittianum I. B. Balfour (Notes Roy. Bot. Gard. Edinburgh 10: 108. 1917), described from Yunnan, was considered to be an obscure hybrid of R. racemosum by Cullen (Notes Roy. Bot. Gard. Edinburgh 39: 113–114. 1980).

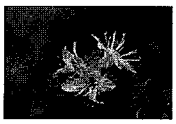

image of 4/1/ M.Lewis

Cultivation: Easy in sun or light shade and is a bit drought tolerant
Record Notes: Name checked with The Plant List on 9/17/2013 by Mona Bourell.

Rhododendron rex ssp. rex — Ericaceae !

INFO
Common Name:
Perennial Tree
Flowers creamy-white, pale yellow to pink, with a crimson basal blotch
Native Range: Myanmar, Tibet, China
Description: From FOC: Small trees, usually 5–7 m tall, branchlets stout, 10–15 mm in diam. below inflorescence; young shoots grayish tomentose, glabrescent. Petiole terete, 25–30 mm, densely grayish tomentose; leaf blade leathery, obovate-elliptic to elliptic, 17–27 × 4–13 cm; base cuneate; apex obtuse; abaxial surface with persistent, 2-layered indumentum, upper layer fawn to rufous, hairs cup-shaped, only slightly fimbriate, lower layer thin, appressed; adaxial surface green, glabrous, midrib prominent abaxially, grooved adaxially, lateral veins 20–24-paired, regular, prominent abaxially. Inflorescence 15–20(–30)-flowered; rachis 20–25 mm. Pedicel sparsely pale brown-tomentose; calyx teeth 8, 1–2 mm; corolla obliquely campanulate, creamy-white, pale yellow to pink, with a crimson basal blotch, ca. 5 cm, lobes 8, suborbicular, ca. 1.5 cm; stamens 16, 2–3.5 cm, filaments pubescent at base; ovary conoid, ca. 12 mm, pale brown tomentose; style ca. 4 cm, glabrous, stigma swollen. Capsule curved, 25–40 × 6–10 mm, densely tomentose. Fl. May–Jun, fr. Aug–Sep.

Pinus forests, Rhododendron thickets; 2300–4000 m. SW Sichuan, SE Xizang, N and W Yunnan [NE Myanmar].
For subspecies:

1 Leaves smaller, indumentum discontinuous, sometimes quickly lost. subsp. gratum
+ Leaves larger, indumentum persistent. (2)

2 (1) Leaf blade usually obovate, with grayish or brownish indumentum. subsp. rex
+ Leaf blade usually elliptic, with rufous brown indumentum. subsp. fictolacteum

Rhododendron riparioides — Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Purple
Native Range: China: Yunnan
Synonomy: Rhododendron calostrotum subsp. riparioides Cullen

Description: Upright shrubs, to 1.5 m tall; young shoots with dense stipitate or sessile scales, strap-shaped setae absent. Petiole 2–6 mm, densely scaly, without strap-shaped setae; leaf blade elliptic to ovate-elliptic, (1.2–)1.8–3.8 × (0.6–)0.8–2 cm; margin lacking strap-shaped setae; apex generally acute; abaxial surface scales overlapping, arranged in 2–3 tiers, orange-pink; adaxial surface greenish blue-gray, matt. Inflorescence terminal, to 5-flowered. Pedicel 0.8–2 cm, lacking multicellular hairs; calyx reddish purple or pale red, 5-lobed to the base; lobes 4–7 mm, elliptic, ovate or nearly rounded, ± pubescent or glabrous; corolla openly funnel-campanulate, bright purple, with darker flecks; outer surface not scaly, pubescent; stamens 10, 1.2–1.8 cm; style longer than stamens, glabrous or pubescent at base. Capsule not known.
Rocks above Abies forests; 3600–4800 m. NW Yunnan.
Janet C. Cubey (WSY) is acknowledged for her contribution to the account of this species. Recent research by Cubey (A cytological and morphological taxonomic study of Rhododendron L. subsection Saluenensia. PhD thesis, University of Liverpool. 2003) has shown that R. calostrotum var. (or subsp.) riparioides is consistently tetraploid (2n = 52*) and is therefore genetically isolated from the diploid R. calostrotum and its var. calciphilum (2n = 26). This distinction is confirmed by the morphological differences mentioned above. For these reasons Cubey here proposes the name R. riparioides.
Cultivation: Bright light with good drainage. (-10/R 1/3)
Record Notes: Name checked with The Plant List on 9/23/2014 by Mona Bourell. Received as Rhododendron calostrotum subsp. riparioides , which is a synonym.

Rhododendron roseatum Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: Myanmar, China: Yunnan
Synonomy: Rhododendron lasiopodum Hutchinson.
Description: Shrubs, sometimes small trees, 1.2–3(–4) m tall; young shoots pale brown, sparsely scaly. Petiole 5–12 mm, sparsely scaly; leaf blade ovate, 6–10 × 2–4.5 cm; base obtuse, rounded or broadly cuneate; apex triangular, acute, or acuminate, apiculate; abaxial surface pink green, gray-white, scales less than 1 × their own diameter apart to nearly contiguous, rarely 1 × their own diameter apart, unequal, brown or brownish red; adaxial surface densely brown scaly when young; midrib flat raised abaxially, slightly concave adaxially; lateral veins 6–8-paired, thin, inconspicuous on both sides. Inflorescence terminal, umbellate, 2–4-flowered. Flowers fragrant. Pedicel 1–2 cm, densely scaly; base gray-white-pubescent; calyx undeveloped, lobes 5, densely scaly; corolla broadly funnelform, 5-lobed to the middle, pinkish in bud, white tinged with pale red at anthesis, 5.5–7 cm, tube gray-white-pubescent, lobes rounded, densely scaly; stamens 10, unequal, half as long as corolla lobes; filaments pubescent below; ovary 6-locular, densely scaly; style as long as corolla, basal part scaly. Capsule cylindric-ovoid, ca. 15 mm, densely brown-scaly. Fl. May–Jul.
Evergreen broad-leaved forests, forests on hilltops, open slopes, rocks; 2000–3000 m. Yunnan [NE Myanmar].

Record Notes: Name checked in the Flora of China, 4/22/2008.

Rhododendron rubiginosum Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Flowers Rosy lilac
Native Range: China
Description: Shrubs or sometimes small trees, evergreen, 1–3(–10) m tall; young shoots stout, brown, scaly. Petiole 5–13 mm, densely scaly; leaf blade elliptic or elliptic-lanceolate or oblong-ovate, 3.5–8 × 1.3–3.5 cm; base cuneate, broadly cuneate to rounded; apex acuminate, sometimes acute; abaxial surface scales dense, unequal rust-brown, glandlike or thin; adaxial surface scales dense when young, caducous. Inflorescence terminal, umbellate, 5–7-flowered. Pedicel 1–2.5 cm, densely scaly; calyx undulate or 5-lobed, small, scales absent except sometimes a few along margin or present and dense; corolla broadly funnelform-campanulate, pale purple to rose-red or pale red, rarely white tinged with pale purple, inside with purplish red or red spots, 2.5–3.5 cm, outer surface sparsely scaly; stamens 10, unequal, slightly longer than corolla; filaments glabrous or pu- bescent below; ovary 5-locular, densely scaly; style longer than stamens, glabrous or pubescent below. Capsule cylindric, up to 18 mm. Fl. Mar–Jun, fr. Jul–Aug.
Style glabrous

Notes

Rhododendron rubineiflorum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Red
Native Range: New Guinea
Description: Extremely dwarf. Spreads by underground rhizomes.
Section Euvireya: Subsection Linnaeopsis
Height - 0.2m - epiphytic or on peat banks
Leaves - elliptic to ovate - 1.0 x 0.6cm
Flowers - broadly campanulate - 2.0cm - mainly solitary
Location - Indonesia: W.New Guinea: Mt. Carstenz; Papua New Guinea: widespread
2600-3400m
Epithet - "with ruby-red flowers"

R.rubineiflorum has ruby red flowers measuring one and a half centimetres (5/8") across the lobes. It is quite widespread in Papua New Guinea and has been collected in alpine shrubberies and upper montane forests.

R.rubineiflorum is considered by many enthusiasts to be the smallest rhododendron in the world. This view was supported by the late Norman Cruttwell at the Fourth International Rhododendron Conference at Wollongong in October 1988. At this conference he stated that "on Mt. Giluwe and other mountains I have collected the smallest of all rhododendrons, the prostrate R.rubineiflorum with its surprisingly large ruby flowers." Whilst R.rubineiflorum is a real pygmy, probably the title of the smallest rhododendron in the world should go to R.caespitosu
Record Notes: Name checked with The Plant List on 10/5/2011 by Mona Bourell, and noted as "unresolved" but spelling is correct.
In Section Vireya of Subgenus Rhododendron.

Rhododendron serpyllifolium — Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Native Range: Japan
Description: Much branched semi-evergreen shrubs 1–2 m tall. Branchlets slender, with dense appressed flattened brownish strigose hairs. Spring leaves nearly to same as summer ones; petiole 0.5–1 mm long, appressed strigose;blade thick membranaceous, obovate-oblong, 5–10 mm long, 2–4 mm wide, apex obtuse or subacute and terminating into a gland, base cuneate-attenuate, upper surface sparsely strigose, margin and midrib on lower surface densely strigose. Flower buds terminal, single, lanceolate oblong, acute, ca. 5 mm long, 2 mm wide, generally with one flower; outer scales membranaceous, widely ovate, acute, glabrous on both sides, sparsely minute papillose on hyaline margin, sparsely strigose on upper outside. Flowers mid April to mid May. Pedicel ca. 2 mm long, covered by bud scales, densely appressed strigose. Calyx saucer-shaped, ca. 2 mm in diam., undulate on margin, densely strigose. Corolla pale purple, with red blotches on upper inside, broadly funnelform, ca. 1 cm long, 1.5 cm in diam., dissected about 2/3 corolla length into 5 lobes; tube ca. 3 mm long, glabrous outside, pilose on inside; lobes orbiculate-obovate or obovate, rounded, ca. 7 mm long, 5–6 mm wide. Stamens 5, irregular, 10–13 mm long; filaments minutely papillose on lower 1/3 of length; anthers yellow, elliptic-oblong, ca. 2 mm long. Ovary ovoid, densely strigose. Style 17--20 mm long, exserted, glabrous. Capsule oblong, ca. 5 mm long, 2–3 mm wide, strigose. Seeds fusiform, acute at one end, obtuse or obscurely appendiculate at other end, ca. 1 mm long, 0.4 mm across.

Rhododendron simsii Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs, 2(–5) m tall; branches many and fine, densely shiny brown appressed-setose, setae flat. Summer and winter leaves different. Petiole 2–6 mm. Leaf blade ovate, elliptic-ovate or obovate to oblanceolate, 1.5–5 × 0.5–3 cm; base cuneate or broadly cuneate; margin slightly revolute, finely toothed; apex shortly acuminate. Inflorescence 2–3(–6)-flowered. Pedicel ca. 0.8 cm, densely shiny brown appressed-setose; calyx deeply lobed; lobes triangular-long-ovate, ca. 5 mm, coarsely appressed-hairy, margin ciliate; corolla broadly funnelform, rose, bright to dark red, or white to rose-pink, with dark red flecks on upper lobes, 3.5–4 × 1.5–2 cm, lobes obovate, 2.5–3 cm; stamens 10, ca. as long as corolla, filaments pubescent below; ovary ovoid, 10-locular, densely shiny brown-strigose; style exserted, glabrous. Capsule ovoid, up to 10 mm, densely strigose, calyx persistent. Fl. Apr–May, fr. Jun–Aug.
Corolla bright to dark red, 3.5–6 cm

Rhododendron chaoanense T. C. Wu & P. C. Tam (Med. Mat. Guangdong 4: 35. 1978), described from Guangdong, is apparently close to, and possibly a hybrid of, R. simsii, but differs from that species in its obscure calyx lobes, 7 stamens, and long-exserted style.

Rhododendron simsii var. albiflorum R. L. Liu (Acta Bot. Yunnan. 15: 190. 1993), described from Jiangxi, is probably no more than an albino form of R. simsii.

Rhododendron simsii var. strigosostylum G. Z. Li (Guihaia 15: 298. 1995 ["strigoso-stylum"]), was described from Guangxi and said to differ from var. simsii in having a corolla rose-pink to red, with minute lobes ca. 2 × 1 mm, and a style silky-strigose below. The present authors have seen no material, but, from the original description, it seems likely that this entity is a hybrid of the widely cultivated R. simsii.

Rhododendron simsii has been used widely in horticulture as a parent of both the "pot azalea" cultivars and a range of cultivars grown in the warmer parts of China

Rhododendron sinogrande Ericaceae !

INFO
Common Name:
Perennial Tree
Native Range: China
Description: Trees, 5–12 m tall; shoots stout, 1–1.5 cm in diam., thinly silvery-gray-tomentose. Petiole stout, 30–50 mm, with silvery appressed indumentum; leaf blade thickly leathery, oblong-elliptic to oblong-oblanceolate, 20–70 × 8–30 cm; base broadly cuneate or rounded; margin slightly revolute; apex rounded or obtuse and stiffly mucronate; abaxial surface silvery-gray to buff, indumentum compacted and agglutinated; adaxial surface glabrous; midrib prominent abaxially. Inflorescence racemose-umbellate, 15–20-flowered; rachis 30–60 mm. Pedicel stout, 3–5 cm, with a dense buff tomentum; calyx oblique; lobes 8(–10), ca. 2 mm, triangular, tomentose or glabrescent; corolla ventricose-campanulate, fleshy, creamy-white to pale yellow, 4.5–5.5 cm, with crimson nectar pouches at base inside; lobes 8(–10); stamens 18–20, unequal, filaments densely puberulent at base; ovary ca. 10 mm, densely pale brown-tomentose, eglandular; style glabrous, stigma large and discoid. Peduncle 6–6.5 cm. Capsule large and woody, cylindric, slightly curved, 40–70 × 14–17 mm, densely rusty-tomentose. Fl. Apr–May, fr. Aug–Oct.

Rhododendron spinuliferum Ericaceae !

INFO Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs, 0.5–1(–3.5) m tall; old branches brownish red, nearly glabrous; young shoots gray-pubescent, also hispid. Petiole 3–6 mm, ± pubescent, setose or scaly; leaf blade papery, obovate, elliptic, elliptic-lanceolate, or lanceolate, 3–10.5 × 1.8–3.8 cm; base cuneate; apex acuminate, rarely acute, apiculate; abaxial surface paler, glabrous, sometimes sparsely pubescent along veins, to densely dirty white-pubescent and scaly; adaxial surface yellowish green, glabrous or pubescent; veins conspicuously raised abaxially. Inflorescence subterminal, 2–4-flowered; bud scales white-pubescent and densely scaly outside. Pedicel 2–1 cm, densely pubescent and scaly; calyx shallowly cup-shaped, without conspicuous lobes, small; corolla tubular, narrowed at both ends, bright or orange red, 1.5–2.5 cm; outer surface glabrous, rarely pubescent at lobe base; lobes 5, erect, ovate; stamens 10, unequal, slightly exserted from corolla; filaments glabrous, anthers purplish black; ovary 5-locular, scaly, densely hairy; style exserted from corolla, usually glabrous, rarely pubescent at base. Capsule cylindric, 10–14 mm, scaly, pubescent. Fl. Feb–Jun.

Rhododendron stenopetalum 'Linearifolium' Ericaceae !

INFO
Common Name: spider Azalea
Perennial Shrub
Flowers Rose-lilac
Synonymy: R. macrosepalum 'Linearifolium'; R. linearifolium; 'Seigai Tsutsuji'
Description: When first introduced to western gardens in 1980, it was known as Rhododendron macrosepalum 'Linearifolium.' That is now ammended to R. stenopetalum 'Linearifolium.'

image of © 2007 Mona Bourell, SFBG1999-0729

Broadleaf evergreen shrub, an unusual azalea in that both the leaves and flowers petals are very narrow. Leaves only about 3-5 mm wide and 5 cm long at the middle, tapering gradually to each end, hairy, green, but have a reddish cast in winter. Flowers deeply divided into narrow strap-like petals, 3-4 cm long, purplish pink to strong purplish red, hairy at base.
Of garden origin, not found in nature. Rhododendron stenopetalum is native to Japan (Honshu).
stenopetalum: steno-, narrow, and petalum, petal.
Seattle, Washington: Elisabeth C. Miller Botanical Garden.

image of © 2007 Mona Bourell, SFBG1999-0729

Cultivation: It likes sun to part shade. It is easily harmed by winds.
Record Notes: Orignally received as R. linearifolium, but our plant fits the description of this cultivar which is commonly found in the trade, .

Taxon Family Spelling Checked

Rhododendron stenophyllum — Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 3ft.
Flowers Orange
Native Range: New Guinea
Description: Without doubt one of the most distinctive species in the genus, Rhododendron stenophyllum is easily recognized by its narrow, dark green, linear leaves and waxy orange, 3.5cm, campanulate blooms carried in umbels of up to five flowers. In its native habitat, Rhododendron stenophyllum grows as a terrestrial shrub and can attain a height of 3 metres however rarely exceeds 1 metre in cultivation.
Originally collected as a dried specimen by Sir Hugh Low in 1867, from which the species was named by J. D. Hooker at Kew (stenophyllum = "narrow leaved" G.), it was not until 1894 that the name Rhododendron stenophyllum was validated when Stapf published his paper on the flora of Mount Kinabalu.

There are now considered to be two distinct subspecies within Rhododendron stenophyllum, distinguished by differing leaf size and occurring at different altitudes (see photos of foliage below for comparison).

Rhododendron stenophyllum ssp. stenophyllum is endemic to Gunung Kinabalu, growing in mossy submontane forest at 2700 - 2800m altitude, and has leaves less than 25x as long as wide, measuring 4 - 7cm long and 0.25 - 0.6cm wide. This subspecies is generally the more floriferous of the two.

Rhododendron stenophyllum ssp. angustifolium, which is the form more often seen in cultivation, is of wider distribution. Whilst also found on Gunung Kinabalu, especially along the main summit trail, at the lower elevation of 1500 - 2400m, it is widely seen elsewhere in Sabah (Trus Madi, G. Alab, G. Lumarku and the Long Pasia region), Brunei (G. Pagon), Kalimantan (Bukit Batu Tiban and G. Kemul) and Sarawak (G. Murud). The leaves in this subspecies are more than 30x as long as wide, measuring up to 12cm long by 0.14 - 0.22cm across.

Rhododendron sulfureum — Ericaceae X

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs, evergreen, usually epiphytic, 0.3–1.6 m tall; branchlets scaly, usually setose. Petiole 4–12 mm, densely scaly, often setose; leaf blade leathery, obovate, ovate, oblong-obovate, or elliptic to oblanceolate, 2.6–8.6 × 1.5–4.5 cm; base obtuse or tapering; margin often ciliate when young; apex rounded or subacute, mucronate; abaxial surface glaucous green, scales ca. 0.5 × their own diameter apart, unequal, dark brown or brown, sunk in pits, with crenulate edges, rims upturned; adaxial surface green, somewhat shiny, scaly or glabrous. Inflorescence 4–8-flowered. Pedicel 0.8–2 cm, scaly, sometimes setose; calyx lobes 3–6 mm, ovate to oblong, persisting to enclose mature capsule, scaly, margin usually cilite; corolla broadly campanulate, bright yellow, rarely greenish, not spotted, 1.3–2 cm, tube 8–11 mm, outer surface scaly, sometimes sparsely pubescent, inner surface pilose, lobes rounded; stamens 10, filaments pubescent towards base or in lower 1/2; ovary densely scaly; style stout, sharply bent, short, scaly at base. Capsule cylindric-ovoid, 8–11 mm, densely scaly. Fl. Apr–Jun, fr. Jul–Aug.

Rhododendron taronense 'Evans' Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 5ft.
Flowers White, Pink Apr - May
Native Range:

image of © 2009 mbourell, SFBG2005-0438

image of © 2008 Mona Bourell, SFBG2005-0438

Description: Species description from Flora of China: Shrubs, sometimes epiphytic on trees, 1.2–3 m tall; bark on old branches dark purple, smooth and peeling; young shoots sparsely scaly. Petiole grooved, 8–15 mm, sparsely scaly; leaf blade leathery, narrowly elliptic or oblong-lanceolate, 7–12 × 2.3–4.3 cm, acute at both ends; abaxial surface scales (2–)3–5 × their own diameter apart, brown or yellowish brown, most concave; adaxial surface sparsely scaly; lateral veins more than 10-paired, thin, inconspicuous on both surfaces. Inflorescence terminal, cymose, 4- or 5-flowered; rachis ca. 10 mm, sparsely scaly and densely pubescent. Flowers fragrant. Calyx slightly 5-lobed, densely scaly abaxially, margin glabrous; corolla broadly funnelform, 5-lobed to the middle, white with yellow markings inside, 4–5 cm, lobes rounded, spreading; stamens 10, unequal, long ones as long as or exserted from corolla; filaments pubescent below; ovary 6-locular, densely scaly; style longer than corolla, basal 1/4 scaly. Capsule cylindric-ovate, base oblique, 18–25 mm, densely scaly. Fl. Nov.
Broad-leaved forests by rivers, sometimes epiphytic on trees; 1200–1600 m. Yunnan.
Cullen (Notes Roy. Bot. Gard. Edinburgh 39: 48. 1980) reduced this species to a synonym of Rhododendron dendricola.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Species name checked with IPNI; cultivar name found commonly used in the trade with internet search, 10/11/2006.

Petiole 3–10 mm, scaly; leaf blade leathery, oblong-obovate, narrowly oblanceolate, to narrowly elliptic, (2–)5–7(–10) × (1–) 1.5–2.5(–4) cm; base cuneate; apex obtuse, mucronate; abaxial surface pale glaucous-green, papillose, scales ca. 0.5 × their own diameter apart, sometimes in 2 sizes, the smaller black or brown, with or without widely scattered larger scales; adaxial surface dark green, shiny, scaly. Inflorescence terminal or axillary, umbellate, 3–9-flowered. Pedicel 1–3 cm, densely scaly; calyx lobes 5–8 mm, oblong to rounded, erect or spreading, persistent in fruit, sparsely scaly, margin ciliate or not; corolla tubular-campanulate, pale or dark rose, pink, or purple, 1.5–3.2 cm; tube 11–20 mm, outer surface usually sparsely scaly; stamens 10, shorter than corolla, filaments pubescent towards base; ovary densely scaly; style slender, nearly as long as corolla, longer than stamens, scaly at base or along lower 1/2, otherwise glabrous. Capsule cylindric-ovate, 5–10 mm, densely scaly. Fl. May–Jun, fr. Jul–Aug.
Native habitat: Alpine meadows, rocky slopes, open stony banks, screes, cliffs; 2400–4600 m. SE Xizang, NW Yunnan [NE India, NE Myanmar].

Record Notes: Name checked in Flora of China, 9/23/2009.

Taxon Family Spelling Checked

Rhododendron thomsonii Ericaceae !

INFO
Common Name:
Perennial Shrub/tree
Height: 6-10ft. Spread: 6-10ft.
Flowers Red Spring
Native Range: India, Nepal, Tibet, Bhutan
Description: Shrubs or small trees, 2–4 m tall; older branches pale gray-brown; bark exfoliating in flakes; young shoots greenish, glabrous. Petiole slender, 10–30 × ca. 2 mm, glabrous; leaf blade leathery, oblong-elliptic to ovate or orbicular to obovate, 3–7 × 2–6 cm; base rounded to cordate; margin reflexed; apex rounded, apiculate; abaxial surface glaucous, papillate, with some red glandular hairs, sometimes sparsely hairy; adaxial surface dark green, smooth, glabrous; midrib prominent and raised abaxially, flat adaxially; lateral veins 13–14-paired, conspicuous. Inflorescence racemose-umbellate, 4–8-flowered; rachis 5–12 mm, glabrous. Pedicel 1–2 cm, usually glabrous; calyx with upper half tinged red, lower half green, cupular to irregularly split; lobes 5, 2–12 mm, rounded or truncate, glabrous; corolla campanulate, deep crimson, 4–5 cm, fleshy, lobes 5, suborbicular, ca. 1 × 1.5 cm, emarginate; stamens 10, unequal, 2–3 cm; ovary conoid-cylindric, 5–7 mm, glabrous or glandular-hairy; style 3–3.5 cm, glabrous or densely glandular-hairy; stigma slightly swollen. Capsule oblong, 12–15 × 5–8 mm, glabrous, calyx persistent. Fl. Jun.
Native habitat: Mixed forests, thickets, rocky slopes; 3000–4000 m. S Xizang [Bhutan, N India, Nepal, Sikkim].

Cultivation: For a sheltered spot with acid soil.
Record Notes: Name checked in Flora of China, 9/23/2009.

Rhododendron traillianum Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Native Range: China
Description: Shrubs or small trees, 2–8 m tall; shoots gray- to fawn-floccose when young, soon glabrescent. Petiole 10–20 mm, glabrescent; leaf blade leathery, oblong-lanceolate to elliptic, sometimes oblanceolate, 5–12 × 2.5–5 cm; base rounded; apex acute and apiculate or acuminate; abaxial surface pale brown to fawn or red-brown, indumentum dense, 1-layered, hairs radiate, arms short and pyriform or long and ribbonlike; adaxial surface glabrous. Inflorescence racemose-umbellate, 8–15-flowered; rachis ca. 10 mm, floccose. Pedicel 1.5–2 cm, sparsely brown-floccose; calyx lobes 5, ca. 1 mm, broadly triangular, margin ± ciliate; corolla funnel-campanulate or campanulate, white to pink, with crimson spots and purple-red basal flecks, 2.5–5 cm, lobes 5, deeply emarginate; stamens 10, unequal, filaments pubescent at base; ovary 5–7 mm, glabrous or sparsely to densely red-brown-floccose; style ca. 2.2 cm, glabrous. Capsule cylindric, 15–25 × 4–8 mm. Fl. May–Jun, fr. Aug–Oct.

Leaf blade apex acute, apiculate, abaxial surface pale brown to fawn, with thin, powdery indumentum, hair arms short and pyriform; corolla 2.5–3.5 cm; ovary glabrous or sparsely floccose.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron traillianum var. dictyotum Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Native Range: China
Description: For the species:
Shrubs or small trees, 2–8 m tall; shoots gray- to fawn-floccose when young, soon glabrescent. Petiole 10–20 mm, glabrescent; leaf blade leathery, oblong-lanceolate to elliptic, sometimes oblanceolate, 5–12 × 2.5–5 cm; base rounded; apex acute and apiculate or acuminate; abaxial surface pale brown to fawn or red-brown, indumentum dense, 1-layered, hairs radiate, arms short and pyriform or long and ribbonlike; adaxial surface glabrous. Inflorescence racemose-umbellate, 8–15-flowered; rachis ca. 10 mm, floccose. Pedicel 1.5–2 cm, sparsely brown-floccose; calyx lobes 5, ca. 1 mm, broadly triangular, margin ± ciliate; corolla funnel-campanulate or campanulate, white to pink, with crimson spots and purple-red basal flecks, 2.5–5 cm, lobes 5, deeply emarginate; stamens 10, unequal, filaments pubescent at base; ovary 5–7 mm, glabrous or sparsely to densely red-brown-floccose; style ca. 2.2 cm, glabrous. Capsule cylindric, 15–25 × 4–8 mm. Fl. May–Jun, fr. Aug–Oct.

For the variety:
Leaf blade apex acuminate, abaxial surface red-brown with thick, felted indumentum, hair arms long and ribbonlike; corolla 4–5 cm; ovary densely floccose.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Taxon Family Spelling Checked

Rhododendron trichostomum Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China: Szechuan and Yunnan Provinces
Description: Small, intricately branched shrubs, 0.3–1(–1.5) m tall; branchlets twiggy, densely scaly, setose; bud scales deciduous, rarely persistent. Petiole 2–4 mm, scaly; leaf blade aromatic, linear, linear-lanceolate, oblong or oblanceolate, 0.8–3.2 × 0.3–0.5(–0.8) cm; base rounded to tapering; margin revolute; apex acute or obtuse, mucronate or emarginate; abaxial surface scales overlapping, pale yellowish brown to brown, arranged in 2–3 tiers, the lowermost tier golden, paler than others, rarely somewhat; adaxial surface dark green, scaly or not. Inflorescence 6–10(–20)-flowered. Pedicel (0.1–)0.2–0.5 cm, scaly; calyx lobes 0.5–2(–3) mm, oblong to ovate, persistent, scaly or not, margin usually scaly, ciliate; corolla narrowly tubular, white, pink or rose, 0.8–1.6(–2) cm, tube 4.5–8(–12) mm, outer surface densely scaly or not scaly, throat densely pilose; lobes with a few scales but no hairs; stamens 5, included in corolla tube, filaments glabrous; ovary ca. 1 mm, scaly; style turbinate, shorter than or equal to ovary. Capsule ovate to cylindric, 3–5 mm, densely scaly. Fl. May–Jul, fr. Aug–Sep.
Leaves usually oblong or oblanceolate; corolla white to rose.

Rhododendron hedyosmum I. B. Balfour (Notes Roy. Bot. Gard. Edinburgh 9: 234. 1916) was described from cultivated material derived from seed collected in Sichuan. Known only in cultivation, it is a large-flowered variant, and probably a hybrid, of R. trichostomum.

Rhododendron valentinianum Ericaceae !

INFO Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs, 0.3–3 m tall; old branches deep gray, glabrous, branches short; young shoots scaly, densely brown-villous. Petiole stout, 3–5(–15) mm, scaly, hispid; leaf blade thick, leathery, oblong-elliptic, 3–4(–10) × 1.5–2(–6.5) cm; base broadly cuneate or bluntly rounded; apex obtuse and rounded or acute, apiculate; abaxial surface scales ca. 0.5 × their own diameter apart or contiguous, brown, midrib ± brown-hispid; adaxial surface sparsely scaly, brown or hispid along center when young; midrib and lateral veins raised abaxially, concave adaxially; lateral veins inconspicuously concave above. Inflorescence terminal, cymose, 2–4-flowered; bractlets present at anthesis, linear-spathulate, longer than pedicel, densely white-pubescent outside. Flowers fragrant. Pedicel 0.5–1.5 cm, scaly, sometimes also strap-shaped-setose; calyx 5-lobed to the base; lobes membranous, 4–8 mm, oblong or oblong-ovate to ovate, persistent in fruit, densely glandular scaly, margin strap-shaped-ciliate or without hairs; corolla funnelform-campanulate, intensely yellow, 2–3.5 cm, densely glandular-scaly and pubescent outside, lobes orbicular; stamens 10, unequal, shorter than corolla; filaments densely villous below, anthers oblong, pale red; ovary 5-locular, densely scaly; style slightly curved, as long as corolla or shorter than stamens, base with a few scales only. Capsule ovoid, 9–15 mm. Fl. Apr–May.

Pedicel strap-shaped-setose; calyx lobes to 8 mm, oblong-ovate to ovate, margin strap-shaped-ciliate.

Rhododendron veitchianum Ericaceae !

INFO Common Name:
Perennial Shrub
Flowers White with yellow blotch. Mar, Apr
Native Range: S Burma, Laos, Thailand and Vietnam
Description: Large and vigorous, but often compact-growing shrubs with smooth and shiny reddish brown bark. The large fragrant flowers are white, often with a yellow blotch and typically frilled or wavy along the outer part of the lobes. Quite variable in terms of blooming season and requiring excellent drainage. Native to S Burma, Laos, Thailand and Vietnam where it occurs from 3,000 to 8,000 ft. as an epiphyte, on rocks and cliffs or dry evergreen forests.
Record Notes: Name checked with The Plant List on 3/31/2014 by Mona Bourell.

Rhododendron vialii — Ericaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-4ft.
Flowers Dark red Feb
Native Range: Laos, Vietnam, China: Yunnan
Synonymy: Rhododendron viali
Description: Shrubs, 2–4.5 m tall; young shoots densely pubescent. Petiole 15–22 mm, glabrous or puberulent; leaf blade subleathery, lanceolate, oblong-lanceolate or obovate-lanceolate, 4–9(–12) × 1.8–4 cm; base narrowly cuneate; margin slightly revolute; apex acuminate, cartilaginous-mucronate; lateral veins reaching margin. Inflorescence subapical, 1-flowered. Pedicel 0.4–0.8 cm, glandular-hairy; calyx deeply lobed; lobes dark red, oblong-rounded, 5–6 mm, densely glandular-setose at base abaxially, margin with dense sessile glands; corolla broadly tubular or tubular-funnelform, dark red, ca. 2.5 cm; tube broadly cylindric, ca. 15 mm, ca. 4 mm wide at base, outer surface glabrous, inner surface puberulent; lobes oblong, ca. 1 cm, glabrous, apex slightly emarginate; stamens 5, as long as or slightly shorter than corolla; filaments glabrous. Capsule ovoid, ca. 6 × 5 mm, densely glandular-setose. In China: Fl. Feb–Apr, fr. Aug–Nov.
Native habitat: Thickets; 1200–1800(–2800) m. S Yunnan [Laos, Vietnam].

Cultivation: Slow growing, hardy to about 0 deg F. Sun or part shade.
Record Notes: Name checked with Flora of China, 4/13/2009.

Rhododendron wardii Ericaceae !

INFO
Common Name: Rhododendron
Perennial Shrub
Height: 20'ft.
Flowers Yellow Apr, May
Native Range: China
Description: Saucer shaped bright yellow flowers with a crimson blotch in trussels of 7-14
Shrubs ca. 3 m tall; old branches grayish white, bark sometimes flaking; young shoots greenish, glabrous. Petiole slender, furrowed above, 20–30 mm, glabrous; leaf blade leathery, narrowly ovate to oblong-elliptic or broadly ovate-elliptic, 5–8 × 3–4.5 cm; base subcordate; apex obtuse, apiculate; abaxial surface greenish or grayish green; adaxial surface deep green, midrib raised abaxially, flat or slightly concave adaxially; lateral veins 9–13-paired, inconspicuous on both surfaces. Inflorescence racemose-umbellate, 5–8(–14)-flowered; rachis 5–15 mm, with short glandular hairs. Pedicel 2–4 cm, usually sparsely glandular; calyx membranous, lobes 5, 5–8(–12) × 3–5 mm, unequal, ovate or ovate-elliptic, margin densely glandular; corolla cup-shaped, bright yellow or pure white, 3–4 × 4–5 cm; lobes 5, suborbicular, ca. 1.5 cm, apex emarginate; stamens 10, unequal, 1–1.8 cm, filaments glabrous; anthers ovate, yellow, ca. 2 mm; ovary cone-shaped, ca. 5 mm, densely glandular; style 1.5–2 cm, usually glandular, stigma capitate. Capsule cylindric, slightly curved, 20–25 × ca. 7 mm, glandular-hairy, calyx usually persistent, leaflike at maturity. Fl. Jun–Jul, fr. Aug–Sep.

Leaf blade oblong-elliptic to broadly ovate-elliptic; corolla yellow.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Rhododendron watsonii Ericaceae !

INFO
Common Name:
Perennial Shrub/tree
Flowers Pink with crimson
Native Range: China
Description: Shrubs or small trees, 1.5–6 m tall; young shoots slightly gray-brown tomentose. Leaf blade leathery, oblong-elliptic to broadly oblanceolate or obovate, 10–33 × 4–10 cm; base rounded, with broad wings decurrent into petiole; apex acute; abaxial surface silvery-white to brownish, indumentum thin, compacted and agglutinated; adaxial surface glabrous. Inflorescence a lax short racemose umbel, 12–15-flowered; rachis ca. 10 mm, gray-white pubescent. Pedicel 1.5–3 cm, sparsely floccose, glabrescent; calyx irregular; lobes 7, 1–2 mm; corolla broadly campanulate, white slightly pink tinged with crimson blotch at base, 3.5–4 cm, lobes 7; stamens 14, unequal, filaments puberulent in lower part; ovary glabrous; style ± as long as corolla, glabrous, stigma capitate. Capsule oblong-cylindric, slightly curved, 3–4 × 5–7 mm. Fl. May–Jun, fr. Jul–Sep.

Open forests; 2500–3000 m. S Gansu, W Sichuan.

Rhododendron williamsianum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pink
Native Range: China: Szechuan
Description: Shrubs, 1–2 m tall; older shoots brownish, glabrous; branches slender, 3–5 mm in diam.; young shoots greenish or purplish, with a few glands. Petiole rounded abaxially, flat adaxially, 10–15 mm, sparsely glandular-hairy; leaf blade leathery, broadly ovate or suborbicular, 2.5–5 × 2–4 cm; base cordate or subrounded; apex rounded, with a small cusp; abaxial surface grayish white, with small projections; adaxial surface deep green, glabrous; midrib and lateral veins raised on both surfaces; lateral veins 11–12-paired, veinlets reticulate, obvious abaxially. Inflorescence racemose-umbellate, 2–6-flowered; rachis 5–8 mm, sparsely glandular. Pedicel 2–3 cm, stout, with long-glandular hairs; calyx discoid; lobes 6, 1–2 mm, broadly triangular, outer surface and margin shortly glandular-hairy; corolla broadly campanulate, reddish, 3.5–4 × 4–4.5 cm; lobes 5 or 6, suborbicular, 1–1.5 × ca. 2 cm, emarginate; stamens 10–12(–14), unequal, 1.8–3 cm, filaments glabrous, anthers ovate, deep purple-red; ovary ovate, ca. 5 mm, glandular; style ca. 3.5 cm, nearly equal to corolla, usually glandular, stigma capitate. Capsule cylindric, 15–25 × ca. 6 mm, glandular. Fl. Apr–May, fr. Aug–Sep.

Cultivation: Easy in sun or shade and relatively drought tolerant once established.
Record Notes: In section Vireya of Subgenus Rhododendron. Spelling checked with IPNI, 9/25/2007.

Rhododendron xanthostephanum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Yellow
Native Range: India, Myanmar, China
Synonomy: Rhododendron aureum Franchet [not Georgi (1775)]
Description: Shrubs, evergreen, 1–3(–5) m tall; mature bark smooth, reddish brown, somewhat pruinose; branchlets densely scaly. Petiole 5–13 mm, scaly; leaf blade leathery, oblong-lanceolate, (3–)5–8(–10) × (1–)2–2.5(–3) cm; base usually cuneate; apex acute or rounded, mucronate; abaxial surface silvery brown, scales ca. 0.5 × their own diameter apart, small, unequal, most sunk in pits; adaxial surface brownish green, scaly. Inflorescence usually terminal, racemose-umbellate, 3–5-flowered. Pedicel (0.3–)0.5–0.7(–1.8) cm, densely scaly; calyx lobes (2–) 3–5(–7) mm, rounded, ovate or oblong, erect or spreading, scaly, not ciliate; corolla tubular-campanulate, bright to deep yellow, (1.8–)2–2.5(–2.8) cm, outer surface scaly, lobes shorter than tube; stamens 10, ca. as long as corolla, filaments pubescent towards base; ovary densely scaly; style slender, straight, longer than corolla, scaly at base. Capsule cylindric, (5–)8–10 (–11) mm, scaly.
Abies and Pinus forests, woods, scrub, cliffs; 1500–3500 (–4000) m. SE Xizang, NW Yunnan [NE India, N Myanmar].

Taxon Family Spelling Checked

Rhododendron yakushimanum Ericaceae !

INFO
Common Name:
Perennial Shrub
Native Range: Japan Yakushima Is.
Synonomy: Rhododendron degronianum Carrière subsp. yakushimanum (Nakai) H.Hara
Description: Evergreen shrubs 0.5–2 m tall. Young shoots densely brownish-villous. Leaves coriaceous, alternate; petiole 1–2 cm long, brownish villous when young; blade oblong to narrowly oblong, 4–9 cm long, 1.5–2.5 cm wide, revolute on margin, apex acute, base obtuse or acute, upper surface glabrous, lower surface with dense fuscous villous tree hairs. Flower buds terminal, solitary, globose, ca. 13 mm long, 10 mm across; outer scales orbicular, short pilose on outside and margin. Flowers late May to mid June. Inflorescences corymbose, with 7–18 flowers, rachis 6–10 mm long, villous. Pedicel 1–3 cm long at flowering, 2.5–5 cm long at fruiting, villous. Calyx saucer-shaped, ca. 4mm in diam., densely villous. Corolla white tinged with bright red when young, later pure white with faint purple blotches on inside above, openly campanulate, 3–3.5 cm long and across, 5 (rarely 6)-lobed about 1/3 of length; tube ca. 1.5 cm long, glabrous outside, sparsely pilose inside; lobes orbicular, emarginate, ca. 1.3 cm long, 1.5–2 cm wide. Stamens 10 (rarely 12), irregular, 1–1.5 cm long; filaments densely pilose on lower 1/3 of length; anthers oblong, 2–3 mm long. Ovary ovoid densely villous. Style ca. 2 cm long, glabrous. Capsule cylindrical, 2–2.5 cm long, 0.6 mm wide, densely fuscous villous. Seeds oblong, 2.2–2.5 mm long, 1 mm wide, acute or truncate at one end, laciniate appendiculate at other end.

Taxon Family Spelling Checked

Rhododendron yedoense var. poukhanense Ericaceae !

INFO
Common Name: Korean azaliea
Perennial Shrub
Height: 3-6ft. Spread: 6-12ft.
Flowers Lavender, rose-purple
Native Range: Korea
Description: Predominate Flower Color: Lavender
Flower / Truss Description: Broadly funnel-shaped, fragrant, rose-pink to pale lilac-purple. Inflorescence 2-3 flowered.
Fragrant: Yes
Bloom Time Early Midseason

Height (ft.) in 10 Yrs: 4

Foliage Description: Leaves elliptic-lanceolate to oblanceolate, spring leaves deciduous, to 3" long, summer leaves smaller, almost deciduous.
Elepidote

Plant Habit: Semi-upright shrub

Sub Genus: Tsutsusi
Section: Tsutsusi

Geographical Origin: Korea, Japan (Tsushima)
This Korean azalea is a spreading, low to medium sized shrub which typically grows 3-6' tall with an 8-12' spread. Evergreen in mild winters, but deciduous in cold winter climates. Dark green foliage turns an attractive orange-red in autumn. Lavender to rose purple, slightly fragrant, 2" wide flowers, each with a darker blotch, appear in trusses of 2-4 flowers each in early spring (April-May in the St. Louis area). An important parent in the development of many of the hybrid evergreen azaleas in commerce today.

Cultivation: Cold Hardiness Temperature: -15°F (-26°C)
Zone: 4 to 9
Sun: Full shade to full shade
Water: Medium
Maintenance: Medium
Wildlife: Attracts Hummingbirds, Attracts Butterflies
Tolerates: Rabbits
Uses: Hedge
Best grown in acidic, humusy, organically rich, medium moisture, moisture-retentive but well-drained soils in

Taxon Family Spelling Checked

Rhododendron yuefengense Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pink
Native Range: China: Guangxi
Description: Shrub from 0.5 to 1.5 m. The olive-green leathery leaves are oval-round from 4.5 to 9.5 cm long and 4-9 cm wide. Base rounded, heart-shaped with a short (3 cm), slightly winged petiole. Inflorescence consists of 50 to 10 white-pink flowers, each of which is 3 cm wide. Calyx small with wavy rim. Pistils with hairs. Stigmas reddish, stamens smooth.
From Flora of China:
It is very close to, and probably a synonym of, R. platypodum, apparently differing only in its smaller stature (0.5–1.5 m tall) and glabrous stamens. The other differences quoted in the original description do not significantly differentiate between the two species.

Cultivation: Hardy to -8F
Record Notes: Name checked with The Plant List on 9/23/2014 by Mona Bourell.
May be synonymous with R platypodum. Name checked with Flora of China, 5/21/2010.

Rhododendron zaleucum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White to pink
Native Range: Myanmar, China: Yunnan
Description: Shrubs or small trees, 1–3(–6) m tall; young shoots sparsely scaly. Petiole 7–13 mm, sparsely brown-scaly; leaf blade elliptic, ovate-lanceolate, or lanceolate, 4–7 × 1–2.5 cm; base cuneate to rounded; apex acute to acuminate, apiculate; abaxial surface pinkish white, papillate, scales 1.5–4 × their own diameter apart, unequal, yellow, glabrous or pubescent, at least along midrib; adaxial surface without scales, sparsely pubescent along midrib when young. Inflorescence terminal, shortly racemose, 3–5-flowered; rachis 2–5 mm, scaly, otherwise glabrous, rarely pubescent. Pedicel 1–1.5 cm, sparsely scaly; calyx rimlike or 5-lobed; lobes ca. 1 mm, rounded or ovate-triangular, scaly, glandular; corolla broadly funnelform-campanulate, 5-lobed to the middle, white to pink, 3–4 cm, outer surface densely glandular scaly, tube sometimes pubescent; lobes rounded-ovate; stamens unequal, 1.3–3.3 cm, longer than corolla; filaments at base spreading-pubescent; ovary 5-locular, densely scaly; style long, glabrous or pubescent at base. Capsule cylindric, 8–15 mm. Fl. Apr–Jul, fr. Jul–Aug.
Conifer-Rhododendron forests, thickets on slopes; 2800–3400 m. Yunnan [Myanmar].
Abaxial leaf surface glabrous; style glabrous or pubescent at base.
Record Notes: Spelling checked in GRIN database 12-17-2005; further research needed on authors, native regions, common names, etc.

Rhodoleia championii Hamamelidaceae !

INFO
Common Name:
Perennial Tree
Native Range: China
Description: Trees, to 12 m tall; young branches stout, drying dark brown, glabrous. Petiole 3–5.5 cm; leaf blade ovate to broadly ovate, 7–16 × 4.5–10.5 cm, firmly leathery, drying discolorous, abaxially whitish gray, usually glabrous or sometimes with remains of brown stellate scales or stellate indumentum that appears tuberculate on drying, base broadly cuneate, apex obtuse or subacute; obscurely 3-veined at base, lateral veins 7–9 on each side at ca. 60° to midrib, conspicuous on both surfaces, reticulate veins obscure. Inflorescences 3–4 cm, 2.5–3.5 cm wide in fruit; peduncle 2–3.8 cm, with several scalelike bracts; involucral bracts many, ovate-rounded, brown pubescent; bracteoles 5 or 6, scalelike. Petals spatulate, 25–35(–40) × 4–8 mm. Stamens as long as petals, filaments glabrous, 1.5–2 cm, anthers 4–6 mm. Ovary glabrous; styles somewhat shorter than stamens. Capsules 5, ovoid-globose, ca. 1.2–1.5 cm, styles not persistent, pericarp thin-woody. Seeds yellow-brown, flattened. Fl. Feb–Apr, fr. May–Aug.

Forests; ca. 1000 m. C and W Guangdong, Guizhou, Hainan [Indonesia (Sumatra), W Malaysia, Myanmar, Vietnam].

Records of Rhodoleia championii from outside China must be treated with caution; collectors have commented on the similarity of the foliage to that of Rhododendron.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

7 potted 5/99.

Rhodophiala advena — Liliaceae !

INFO
Common Name: Añañuca
Height: 0.5-1ft.
Flowers Red mid spring - early fall
Native Range: Chile
Synonomy: Hippeastrum advena
Cultivation: Minimum watering. Once a week during growing season. Plants obtained from seed, should complete the first growing cycle in approximately 3 months. Watering should start again in next late autumn.
As most bulbous species, Rhodophiala advena seeds take 3-4 years to become flowering plants.

Propagation: Put seeds in pure Water at 15° C degrees, for 72 hours or until germination.
Once seedlings have germinated, sow them in a soil mix of 50% well-decomposed leaf mold and 50% grit. Lightly cover seeds with sand.

Record Notes: Name checked with IPNI, 8/16/2006.

Rhoicissus tomentosa — Vitaceae !

INFO
Common Name: evergreen grape, Bosdruif
Perennial Vine/Liana
Native Range: Southern Africa
Synonomy: Cissus tomentosa Lam.,Vitis capensis (Willd.) Thunb. non Burm.f., Cissus capensis Willd. (1753) , Rhoicissus capensis (Willd.) Planch. (1887)

Description: Liana to 30 m long; stems to 25 cm Ø, with aerial roots hanging vertically from a low height (like a Ficus); occasionally a tree 3-7 m tall; young branchlets rusty-hairy, later glabrescent and with large pale lenticels; tendrils velvety;leaves simple.

Biology: perennial -Climber - Ht indefinite Alt: 30 - 1230 m.
Distribution: Tropical Africa, South Africa: EC, KN, LP, MP, WC, SWZ
Cultivation: Needs climbing surface, semi-shaded conditions, regular water, and rich soil. It is prone to caterpillar problems (it is a larval host plant of Sphinx moths (Sphingidae) in S. Africa).
Propagation: Propogate by seed or cutting in spring/summer.

ACCESSION

Rhopalostylis baueri — Arecaceae !

INFO
Common Name: Norfolk Island Palm
Perennial Palm
Height: 30-50ft. Spread: 10-15ft.
Flowers White
Native Range: Norfolk Island
Description: Very similar to R. sapida , but stouter, and with thicker petioles. Its fruit is small, ovoid/ellipsoid, and dull red/brown in colour.

This tall palm has a distinctly smooth, ringed trunk and a narrow, erect crown shaped like a shaving brush.

Not cold hardy
Cultivation: part shade to full sun in Med. climates; humus laden and moist soil, medium to high water needs, medium to high salt tolerance
Record Notes: Name checked with The Plant List on 9/11/2012 by Mona Bourell.

ACCESSION

10/14/2010 Mona Bourell — Marc found during nursery bed sweep.

Taxon Family Spelling Checked

Rhopalostylis sapida Arecaceae !

INFO
Common Name: Nikau Palm, Feather Duster Palm
Perennial Palm
Height: 25-40ft. Spread: 15-25ft.
Flowers Light purple
Native Range: New Zealand: Chatham Islands
Synonomy: Eora sapida, Areca sapida
Description: A very distinctive palm, with its stiff, upright leaf arrangement (e.g. feather duster like). Leaves to about 2m on plants in the sun, however, they can be considerably longer on plants growing in heavy shade. Grows to about 10m in height, and has a very pronounced bulge at the base of the crownshaft.
Southernmost naturally occurring palm in the world.
Cultivation: Because this is a temperate island dweller, it means it prefers a very mild climate, i.e. it can take light frost, and prefers cooler summers. It is very slow growing, taking up to 15 years to form a trunk. Try and find a wind free spot, since the leaves can get quite windblown and tatty.
Record Notes: Name checked with The Plant List on 9/27/2011 by Mona Bourell.

Wild Collected by Darold Petty; Northernmost population of sp., Little Barrier Island, New Zealand..

Notes

1/3/2007 Tony Morosco	Record deaccessioned 1/3/2007 after complete nursery inventory in 2006. Specimens not found in Nursery. Last reported in bed 0, subbed unspecified and last checked date unspecified.

Rhus angustifolia Anacardiaceae !

INFO
Common Name: willow karee
Perennial Tree
Flowers Cream
Native Range: South Africa
Description: Rhus angustifolia (Willow Karee or Smalblaar) is a small, bushy, evergreen tree which is confined to the South Western Cape in South Africa.

The multi-stemmed Willow Karee bush grows to a height of about 4 meters. It has trifoliate leaves with dark green surfaces and grey furry undersides. Its flowers are small and cream coloured. The female plants produce clumps of tiny berries. In the Western Cape, dense thickets of this bush can be seen growing alongside rivers and roads

Record Notes: Name checked with TROPICOS, 7/6/2011.

Rhus succedanea Anacardiaceae !

INFO Common Name:
Perennial Tree
Native Range: E. Asia, S. Japan to India
Description: Deciduous small to medium-sized tree, 6–10 m or sometimes to 15 m tall; buds glabrous except for yellowish brown pubescence on margins and inner sides of bud scales. Branches glabrescent; lenticels distinct, grayish white. Leaves odd-pinnate, 20–40 cm long inclusive of glabrous petioles (6–8 cm long); leaflets 9–15, widely lanceolate or narrowly oblong, 5–9 cm long, 1.5–3 cm wide, apex long acuminate, base acutish on inner side, semi-rounded on outer side, entire, upper surface glabrescent, lower surface sometimes glaucous, sparsely hispid on veins when young; lateral veins close together, 4 mm or less apart; rachis terete, wingless. Inflorescences axillary, peduncled, 8–20 cm long inclusive of peduncles, glabrous. Flowers May to July, small, yellowish green. Sepals 5, triangular ovate, apex obtuse, ca. 0.8 mm long, glabrous. Petals 5, yellowish green, oblong, ca. 2 mm long. Filaments slightly shorter than petals. Fruits September to October, depressed-globose, 7–10 mm across, slightly flattened, lustrous, glabrous, smooth, pale yellow; exocarp dehiscent and peel off, mesocarp white.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Taxon | Family Spelling Checked

Rhus undulata — Anacardiaceae !

INFO
Common Name: kuni bush
Perennial Shrub/tree
Native Range: Namibia, South Africa: Cape
Description: perennial-Shrub- Ht 0.5 - 3 m. Alt: 20 - 1250 m
Rhus undulata or Kuni Bush is a dense evergreen shrub or small tree native to South Africa. Leaves are trifoliate, dark green with a shiny lacquered look. Leaflets are obovate, small and very sticky. In nature, the shrubs will reach from 3 to 10 feet (1-3 m) tall and wide. The bark is gray-brown, with young twigs being reddish in color. Older growth may or may not have spines. Flowers are borne in terminal inflorescences, star shaped and very small.

Cultivation: Plants grown in containers will be smaller than in nature, which makes them great Bonsai subjects. They are very easy to grow and are hardy in the landscape in USDA zone 9-11.

Blooming: In the greenhouse, we usually have 2 flushes of flowers, one in the spring and one in late summer.
Culture: Rhus undulata needs full sun to light shade with a very well-drained soil mix. We use a soil mix consisting of 1 part peat moss to 1 part loam to 2 parts sand with small gravel added to ensure good drainage. Plants are watered and allowed to dry before watering again. We fertilize the plants once during the spring with a balanced fertilizer. After the summer blooming period, we trim and repot plants as needed. This helps in controlling size. During the winter months, the plants are placed in the cool room where nighttime temperatures do not fall below 48°F (9°C). Water is restricted during this period.

Propagation: Propagation: Rhus undulata is best propagated by seed. We obtained seed from Silver Hill Seeds in South Africa. Seeds were treated with a 45 minute soak in sulfuric acid before sowing. Seeds germinate in 30-60 days after sowing.

Record Notes: Name checked with The Plant List on 8/7/2011 by Mona Bourell.

Taxon Family Spelling Checked

Ribes aureum var. aureum Grossulariaceae !

INFO
Common Name: Golden Current
Perennial Shrub
Height: 4ft. Spread: 4ft.
Flowers Yellow Spring
Native Range: Western North America
Description: shrub less than 3 meters tall, spines and prickles lacking. Leaves alternate; palmately lobed, 15 to 50 mm, base wedge shaped to subcordate; toothed or not, generally glandular when young, glabrous when mature. 5 to 15 flowers per raceme, bright yellow, glabrous; petals 2 to 3 mm; hypanthium 6 to 10 mm, longer than wide, generally twice as long as sepals; sepals yellow; spicy odor. The plant was exported from North America to Europe as rootstock, where it has escaped from cultivation and can be found growing in sandy soils. A host plant for the Zephyr butterfly.
Cultivation: Grow in partial to full sun, low to moderate water, well-drained soil. First entered cultivation in 1812. Widely planted for the fragrant flowers and fruits.

Propagation: Easily propagated from seed or cuttings. Sow seeds in fall and allow to stratify outdoors, or strike cuttings from half-ripe stems in early to mid-spring in loose sandy medium.

ACCESSION

Intended for use in: California Garden

Wild Collected by Tony Morosco and Adam Holbrook s.n.; 18 April 2004 U.S.A. California California, San Joaquin County. Ripon. Along banks of Ripon River at Hwy 99. With Vitus californica, Urtica dioica..
Flower color Yellow

Notes
1/2/2007 Mona Bourell Not found during inventory of Nusery in 2006. Last seen 6 in unspecified sub-bed in 2004. Deaccessioned 1/2/2007.

Ribes aureum var. gracillimum Grossulariaceae !

INFO
Common Name: Golden Current
Perennial Shrub
Flowers Yellow, turning deep red
Native Range: USA California: Lake to San Deigo Co.
Description: Leaf blades 3-lobed, 2-2.5 cm wide. Flowers: hypanthium 6-12 mm, 2-3 times as long as sepals; sepals 3-4 mm; petals yellow, turning deep red.

Flowering Feb-Apr. Alluvial areas, foothill woodlands, forest edges; 100-1000 m; Calif.

Variety gracillimum occurs in the Central Valley and Coast Ranges.

Record Notes: Name checked with Tropicos on 10/25/2011 by Mona Bourell.

Ribes bracteosum Grossulariaceae !

INFO Common Name: stink currant
Perennial Shrub
Native Range: USA California Humboldt
Description: Plants 1-4 m. Stems erect, with dense, yellowish, shiny, sessile, crystalline, round glands, sparsely pubescent throughout; spines at nodes absent; prickles on internodes absent. Leaves: petiole 2-10 cm, sparsely pubescent; blade ovate, deeply 5-7-lobed, cleft 1/2+ to midrib, (1.5-)2-10(-22) cm, base cordate, surfaces with yellow, dull, sessile glands and sparse hairs abaxially, with yellow, shiny, sessile glands and glabrous adaxially, lobes with main segments ovate-lanceolate, margins 1-2 times sharply serrate, apex acute, shallowly lobed. Inflorescences ascending to erect, 20-50-flowered racemes, (10-)15-30 cm, axis sparsely pubescent, flowers evenly spaced. Pedicels jointed, 5-12 mm, pubescent and glandular; bracts conspicuous, proximal ones ovate, lobed, distal ones narrowly oblong, unlobed, (3-)4-5 mm, sparsely glandular and pubescent. Flowers: hypanthium green, saucer-shaped, widely flared, 0.5-1.5 mm, ± pubescent and sparsely glandular abaxially, glabrous adaxially; sepals nearly to somewhat overlapping, spreading, brownish purple to greenish or sometimes nearly white, ovate-lanceolate to oblong-lanceolate, 3-5 mm; petals widely separated, erect, white, cuneate-flabelliform, not conspicuously revolute or inrolled, 1 mm; nectary disc wine red, thick, lobed, covering and submerging ovary; stamens slightly longer than petals; filaments linear to slightly broader at base, 1 mm, glabrous; anthers white, transversely oblong-cordate, 0.5 mm, broader than long, apex shallowly notched; ovary somewhat hairy and densely sessile-glandular; styles connate 1/4-1/2 their lengths, 1 mm, glabrous or hairy. Berries bland, black, subglobose, 8-10 mm, glandular. 2n = 16.

Flowering Feb-Jun. Stream banks, moist woods, floodplains, shorelines, thickets, avalanche tracks; 0 -1700 m; B.C.; Alaska, Calif., Oreg., Wash.

Ribes bracteosum occurs along the Pacific Coast from southeastern Alaska to northern California. Its thin leaves have a sweetish, disagreeable odor and the

Ribes californicum var. hesperium Grossulariaceae !

INFO
Common Name: hillside gooseberry
Perennial Shrub
Native Range: California Coast Ranges
Synonomy: Ribes hesperium, Grossularia hesperia
Description: For species: Stem: nodal spines 3; internodes generally glabrous
Leaf: blade 10–30 mm, lower surface nonglandular; Leaf hairy
Inflorescence 1–3-flowered
Flower: hypanthium 2 mm, ± as long as wide; sepals reflexed, 6–8 mm, green to red; petals 3 mm, white, margins curled inward; anthers exserted from petals, exceeded by styles, tips with a short, sharp, flexible point
Fruit 9–10 mm, red; shorter bristles glandular
For variety:
Flower: sepals red; stamens ± = to barely > petals
Ecology: Chaparral, woodlands
Elevation: < 1000 m.
Bioregional distribution: Western Transverse Ranges, San Gabriel Mountains, Peninsular Ranges (Santa Ana Mtns)

Cultivation: Information from the Jepson Horticultural Database for Ribes californicum var. hesperium
Given excellent drainage (modification of compacted or other water-holding soils may be necessary), grows especially well in zones 15, 16, and 17 and also in zone 6.

Given excellent drainage (modification of compacted or other water-holding soils may be necessary) and full or part shade (morning and winter sun may be tolerated), grows in zones 7, 14, 18, 19, 20, 21, 22, 23, and 24.

Ribes davidii Grossulariaceae !

INFO

Common Name:
Perennial Shrub
Height: 3ft.
Flowers Greenish white or yellowish green
Native Range: China
Description: Shrubs evergreen, dioecious, 0.3-1 m tall. Branchlets spreading, glabrous, unarmed. Buds ovoid to oblong-ovoid, 3-6 mm, apex acute to shortly acuminate; scales herbaceous, glabrous. Leaves 2-5-clustered at branchlet apex; petiole 0.5-1.5 cm, glandular hairy; leaf blade obovate-elliptic to broadly elliptic, 2-5 × 1.5-3 cm, leathery, glabrous, prominently 3-veined, base cuneate, margin unlobed or 3-lobed; lobes (or leaf blade) coarsely crenate-dentate at distal margin, apex obtuse or acute. Male racemes erect, 2-4 (-6) cm, 5-18-flowered, female ones often axillary, 2-3 cm, 2-3(-7) flowered; rachis and pedicels pubescent and stalked glandular, glabrescent; bracts elliptic to broadly so, 7-9 mm, glabrous or margin sparsely ciliate, 1-veined. Calyx greenish white or yellowish green, glabrous; tube pelviform, 2-4 mm; lobes broadly ovate to obovate-oblong, 2.5-4 mm. Petals cuneate-spatulate to obovate, ca. 1/2 as long as calyx lobes. Stamens subequaling petals. Ovary glabrous. Style 2-lobed. Fruit purple, ellipsoid, rarely subglobose, 0.8-1.1 × 0.6-0.8 cm, glabrous. Fl. Apr-May, fr. Jun-Jul.

Native habitat: Deciduous and mixed forests, ravine forests, shady and moist places on mountain slopes, cliffs, rocks, roadsides; 900-2700 m. N Guizhou, SW Hubei, SW Hunan, Sichuan, NW Yunnan

Ribes laurifolium Grossulariaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs evergreen, dioecious, much branched, usually climbing on trees, rarely small trees to 1.5 m tall. Branchlets smooth, glabrous, unarmed. Buds ovoid to narrowly so, apex acute to shortly acuminate; scales brown, ovate, glabrous or margin ciliate. Leaves 2-4-clustered at branchlet apex; petiole robust, 7-18 mm, remotely glandular hairy; leaf blade ovate to ovate-oblong or elliptic, 5-10 × 2.5-4.5 cm, leathery, glabrous, 3-5-veined, base broadly cuneate to rounded, margin unlobed, coarsely sharply serrate, apex acute. Male racemes pendulous, 3-6 cm, up to 12-flowered, female ones erect, nodding in fruit, 2-3 cm; rachis pubescent and often shortly stalked glandular; bracts greenish, oblong, 10-12 mm, 1-veined, margin sparsely glandular hairy. Male flowers 10-12 mm in diam., female ones 6-8 mm in diam.; pedicel 3-7 mm, pubescent or glabrous. Calyx yellowish green, pubescent or glabrous; tube cupular; lobes broadly oblong to suborbicular, ca. 4 mm. Petals cuneate-spatulate, ca. 2 mm. Stamens subequaling petals. Ovary oblong, pubescent or glabrous. Style 2-lobed. Fruit purple, ellipsoid to oblong, 1.5-2 × 0.7-1 cm, pubescent or glabrous. Fl. Apr-Jun, fr. Aug-Oct.

* Forests, slopes, river banks, rocks; 2100-3600 m. Guizhou, W Sichuan, Yunnan.

Pedicels, calyx, and fruit pubescent

Record Notes: Dioecious, evergreen. Award of Merit, 1912. Spelling checked in GRIN database 12-17-2005; further research needed on authors, native regions, common names, etc.

Ribes malvaceum Grossulariaceae !

INFO

Common Name: Chaparral Currant
Perennial Shrub
Flowers Pink Oct, Nov, Dec
Native Range: California: Tehema - San Diego Co.
Description: Plants 1-2 m. Stems erect, tomentose with gland-tipped, bristly hairs; spines at nodes absent; prickles on internodes absent. Leaves: petiole 1-5 cm, pubescent and stipitate-glandular; blade roundish, 3-5-lobed, cleft nearly 1/4 to midrib, 2-6 cm, base deeply cordate, surfaces stipitate-glandular, glands colorless, and tomentose abaxially, rough-hairy adaxially, (dark green and rugose), lobes deltate, margins biserrate, apex obtuse. Inflorescences pendent, 10-25-flowered racemes, 3-5 cm, axis stipitate-glandular, flowers evenly spaced. Pedicels jointed, 1-2 mm, pubescent, stipitate-glandular; bracts oblanceolate or wider, 6-9 mm, pubescent, stipitate-glandular. Flowers: hypanthium pink, narrowly tubular-urceolate, 5-8 mm, stipitate-glandular abaxially, villous-pubescent adaxially; sepals nearly overlapping at base, spreading, pink to purple, obovate, (1.5-)4-6 mm; petals nearly connivent, erect, pink to white, oblong-elliptic, not conspicuously revolute or inrolled, 2-3 mm; nectary disc not prominent; stamens nearly as long as petals; filaments broader toward base, 0.6 mm, glabrous; anthers white, ovate, 1.2-1.3 mm, apex minutely apiculate; ovary densely stipitate-glandular; styles connate nearly to stigmas, 6-7 mm, sparsely hairy. Berries palatable, purple, globose, 6-7 mm, hairs glandular.

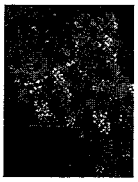

image of © 2011 Mona Bourell SFBG

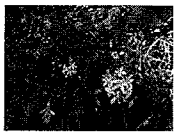

image of © 2011 Mona Bourell, SFBG

Flowering Oct-Apr. Chaparral, oak woodlands; 0-1500 m; Calif.

Ribes malvaceum occurs in the southern North Coast, South Coast, Transverse, and Peninsular ranges, and the Channel Islands. It has also been reported from the Sierra Nevada in Tuolumne County. Its thick, rugose leaves, which are white-tomentose abaxially and dark green adaxially, and glaucous, white-haired berries are striking. Plants with dark green leaves occurring below 800 meters have been recognized as var. malvaceum, those with bright green leaves occurring up to 1500 meters as var. viridifolium.

Ribes malvaceum 'Dancing Tassels' Grossulariaceae !

image of

INFO
Common Name:
Perennial Shrub
Flowers Pink Nov, Dec
Description: Yerba Buena Nursery:
A recent introduction from Rancho Santa Ana Botanical Garden, this selection has the largest flowers of any Chaparral Currant we have come across. The earliest flowering currant we carry, this plant will delight hummingbirds and gardeners alike with its large drooping clusters of pale rose flowers from December to March or so. This species is found growing on hills of the inner and outer coast ranges from Marin to Los Angeles Counties. Plant 'Dancing Tassels' in sun or light shade, with occasional to moderate water.

Cultivation: Plant 'Dancing Tassels' in sun or light shade, with occasional to moderate water.
Record Notes: Cultivar name found used in the trade with internet search, 3/31/2009.

Ribes malvaceum var. viridifolium 'Ortega Beauty' !

Grossulariaceae

INFO
Common Name:
Perennial Shrub
Height: 6ft. Spread: 6ft.
Flowers Red
Description: Ribes malvaceum var. viridifolium 'Ortega Beauty'
This version of chaparral currant, from the coastal mountains of Southern California, is distinguished by its resinous, deeper green leaves. Introduced by Nevin Smith, this colorful selection produces graceful, drooping clusters of red flowers all winter long on six-foot-tall shrubs. Leaves drop soon after fruit ripens. - See more at: http://www.pacifichorticulture.org/articles/a-currant-affair/#sthash.ojqTpOES.dpuf
Cultivation: Sun: Sun
H20: Occ.H2O/dry

Deciduous/Evergreen: Summer deciduous
Growth Rate: Fast
Sun Exposure: Full sun to part shade
Soil Preference: Adaptable
Water Requirements: Drought-tolerant to moderate
Record Notes: Name checked with The Plant List on 6/12/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Ribes menziesii Grossulariaceae !

INFO
Common Name: canyon gooseberry
Perennial Shrub
Native Range: California - Oregon
Synonomy: Grossularia hystrix (Eastwood) Coville & Britton; G. leptosma Coville; G. menziesii (Pursh) Coville & Britton; G. senilis Coville; Ribes menziesii var. hystrix (Eastwood) Jepson; R. menziesii var. ixoderme Quick; R. menziesii var. leptosmum (Coville) Jepson; R. menziesii var. senile (Coville) Jepson

Description: From FNA:
Plants 1-2 m. Stems erect, pubescent, glandular-bristly; spines at nodes mostly 3, 10-15(-20) mm; prickles on internodes dense. Leaves: petiole 1-2.5 cm, pubescent, stipitate-glandular; blade broadly ovate, 3-5-lobed, cleft less than 1/2 to midrib, 1.5-2.5 cm, base semitruncate or slightly cordate, surfaces abaxially pubescent and sessile- or stipitate-glandular, adaxially glabrous or sparsely pubescent, lobes cuneate-rounded, margins crenate-dentate, apex rounded. Inflorescences pendent, solitary flowers or 2-flowered racemes, 2-4 cm, axis short-pubescent, glandular. Pedicels not jointed, 3-6 mm, pubescent, stipitate-glandular; bracts broadly ovate, 3-5 mm, pubescent, stipitate-glandular. Flowers: hypanthium crimson, conic, 2.5-3.5 mm (1/4 -1/3 as long as sepals), white-pilose, with red, stalked glands and red bristles; sepals not overlapping, reflexed, reddish purple or greenish purple, oblong-lanceolate, 7-11 mm; petals connivent, erect, white or pinkish to yellow, broadly flabellate-cuneate, often with inrolled margins, 3-4 mm; nectary disc not prominent; stamens 1.5-1.8 times as long as petals; filaments linear, 3-5 mm, glabrous; anthers white or tan, lanceolate-sagittate, 2.5 mm, apex acute, mucronate; ovary somewhat pubescent and strongly purplish glandular-bristly with longer glandless bristles among gland-tipped hairs; styles connate to middle, 6-8 mm, glabrous. Berries not palatable, reddish purple, ellipsoid-globose, 10-13 mm, pubescent, glandular-bristly.

Flowering Feb-May. Ravines, wooded canyon slopes; 0 -1800 m; Calif., Oreg.

Ribes sanguineum Grossulariaceae !

INFO

Common Name: red-flowering currant, redflower currant, flowering currant
Perennial Shrub
Native Range: Calif - British Columbia
Description: Shrub < 4 m
Stem: nodal spines 0
Leaf thin to moderately thick; blade 2–7 cm, irregularly toothed and finely serrate, upper surface puberulent, lower surface sparsely hairy to whitish tomentose
Inflorescence 10–20-flowered; bracts white to red
Flower: hypanthium 2–7 mm, longer than wide; sepals 4–5 mm, white, pink, or red; petals 2–3 mm, white to red; styles fused ± to tip
Fruit 4–8 mm, blue-black-glaucous; hairs glandular
Chromosomes: 2n=16
Ecology: Many habitats
Elevation: < 2200 m.
Bioregional distribution: Northwestern California (except Inner North Coast Ranges), Central Western California (except Inner South Coast Ranges)
Distribution outside California: to British Columbia
Archibald Menzies is regarded as the first European to discover Ribes sanguineum, which he did in 1793 during his voyage with Capt. George Vancouver. However, it was David Douglas, the famous Scottish plant explorer, who introduced it into British commerce. He found Ribes sanguineum growing near Fort Vancouver soon after his arrival in the spring of 1825. He sent seeds back to England, and the new plants flowered in 1828 when they were a little over two years old. The employer of Douglas, the Horticultural Society, considered this new, red flowering, acquisition to be sufficient justification for the cost, some £400, of his entire three year expedition (Coats, 1992).
sanguineum: blood-red, the flowers.

11/29/2006 Mona Bourell — Terry reports planting 1 out from nursery to 40A, SW corner where another transplanted one[? not in record previously] had died.

Ribes sanguineum 'Brockelbankii' Grossulariaceae !

INFO
Common Name: gold-leaf currant
Perennial Shrub
Height: 5-8ft. Spread: 5ft.
Flowers Pink
Description: Popular for years in England, this brilliantly colored AGM recipient is finally making its way into more American gardens. Pendulous clusters of rosy pink flowers, well-loved by hummingbirds, unfurl just as the fantastic golden leaves emerge, which cool to chartreuse come summer.
Bred oversees from a native Pacific Northwest species, 'Brocklebankii' grows slowly into a neat and open-branched, upright shrub.

Blooms February – early April.

Cultivation: hardy to zone 5.
Record Notes: Name checked with The Plant List on 4/5/2012 by Mona Bourell.

Taxon Family Spelling Checked

Ribes sanguineum 'King Edward VII' Grossulariaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-4ft.
Flowers Red Mar, Feb
Description: A red form, short narrowly compact bush with many upright stems [more compact than most cultivars, 3-4 ft].
Spineless, upright, deciduous, compact tree or shrub. Dark green leaves are slightly hairy, rounded, 3 to 5 lobed, toothed and heart-shaped at the bases, 2 to 4 inches long. One of the darkest red flowered cultivars. Deep red tubular flowers are held in pendant racemes, 2 to 4 inches long and are followed by rounded, glaucous, black fruit, 1/4 inches across

The species was first described in 1793 by Archibald Menzies on the voyage of Captain George Vancouver through coastal waters of the Pacific Northwest.
In 1817 the first specimens made it back to England. It was soon being cultivated to achieve a tamer & flowerier appearance. The very first gardened cultivar was 'King Edward VII,' which was introduced back into its native land decades after journeying to Europe.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 2/17/2011.

Ribes sanguineum var. glutinosum Grossulariaceae !

INFO
Common Name: blood currant, pink-flowering currant, Flowering Currant
Perennial Shrub
Flowers Pink to white.
Native Range: California
Synonymy: Ribes glutinosum
Description: Leaf: blade lower surface sparsely hairy
Inflorescence pendent
Flower: sepals pink to white
Ecology: Many habitats
Elevation: < 1000 m.
Bioregional distribution: North Coast, Outer North Coast Ranges, Central Western California (except Inner South Coast Ranges)
Distribution outside California: Oregon
Synonyms: vars. deductum (Greene) Jeps. and melanocarpum (Greene) Jeps

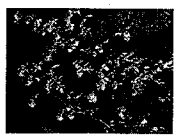

image of © 2010 Mona Bourell, SFBG

image of © 2010 Mona Bourell, SFBG

Cultivation: This currant likes shade to part shade, moderate water in interior, very drought tolerant in coastal gardens. Sometimes growing in deep shade next to a seasonal stream in heavy clay, sometimes on north slopes.
Record Notes: Name checked with the Jepson Manual, 2/18/2010.

Ribes sanguineum var. glutinosum 'Claremont' !

Grossulariaceae

INFO
Common Name: pink flowering currant
Perennial Shrub
Height: 8ft. Spread: 8ft.
Flowers Rosy red buds to pink, Feb, Mar
Description: Geographic Origin: Garden.
Plant Group: Deciduous shrubs.
Hardiness: Sunset zones: A3; 4-9, 14-24. USDA zones: 6 -8. Heat zones: 8-6.
Mature size: Height: 8 feet (2.5 m). Width: 6 feet (2 m).
Flowering period: Late winter to early spring.
Flowering attributes: Rosy-red buds open to small, tubular, pink flowers on 6-inch long racemes that age to red.
Leaf attributes: Dark green, 2-4 inch long, maple-like, 3-5 lobed leaves.
Growth habit: Deciduous, upright shrub or small tree.
This cultivar of pink flowering currant is a Rancho Santa Ana Botanic Garden selection. Will attain a height and spread of 6 - 10 ft. Distinctive for its extra large and long drooping racemes of pink flowers in early spring. Best with light shade and a little summer water. Berries attract many birds including grosbeak and mockingbirds.

Cultivation: Light: Full sun to partial shade.
Soil: Medium fertile, well-drained soil.
Feeding: Side dress with compost in fall.

Pruning Methods: Prune severely after flowering if shrub becomes leggy.
Drought tolerant, but grows faster with summer water. Very clay tolerant.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Propagation Methods: Hardwood cuttings in winter. | Semi-ripe cuttings in late summer and early fall.
Record Notes: Species/variety name found in Jepson Manual; Cultivar name found used in the trade with internet search, 8/4/2006.

Ribes sanguineum var. glutinosum 'Inverness White' !

Grossulariaceae

INFO
Common Name:
Perennial Shrub
Height: 6ft. Spread: 6ft.
Flowers White fading to rose
Description: Selected by Roger Raiche on Inverness Ridge in Marin County. Distinguished from other white flowering cultivars in that the pure white blossoms develop a rosy cast as they fade. Deciduous shrub about 6 ft. tall by 6 ft. wide. Best with a little shade, woodsy soil and a little summer water. Berries attract many birds including grosbeak and mockingbirds.

Ribes sanguineum var. glutinosum 'Pulborough Scarlet' !

Grossulariaceae

INFO
Common Name:
Perennial Shrub
Height: 10ft. Spread: 8ft.
Flowers Deep red with white throat Mar
Description: Red form cultivar.
Pulborough, Sussex in 1933. Upright to 3 m.
Spineless, upright, deciduous, vigorous shrub. Grows to 10 feet tall and 8 feet wide. Dark green leaves are slightly hairy, rounded, 3 to 5 lobed, toothed and heart-shaped at the bases, 2 to 4 inches long. Deep red tubular flowers with white throats are held in pendant racemes, 2 to 4 in. long, followed by rounded, glaucous, black fruit, 1/4 in. across. The species is native to coastal California up to British Columbia.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Culitvar name found used in the trade with internet search, 2/18/2010.

Ribes sanguineum var. glutinosum 'Spring Showers' X

Grossulariaceae

INFO
Common Name:
Perennial Shrub
Height: 8ft. Spread: 6ft.
Flowers Pink
Native Range: California
Description: This selection of one of our north coast natives was made by Nevin Smith from an exposed knoll near Jenner in 1972. It will reach about 6' in height, and has a pleasant vase shape. It has bloomed freely here in the nursery both in the ground and in containers. The flowers are bright pink, borne in long racemes from February to March, and are often visited by hummingbirds. It requires part shade with only occasional water in the summer to look its best.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Ribes sanguineum var. glutinosum 'Strybing Pink' !

Grossulariaceae

INFO

Common Name: Flowering Currant, red-flowering currant, redflower currant
Perennial Shrub
Height: 6+ft. Spread: 4ft.
Flowers Rose pink February - March, Feb, Mar
Native Range: Western North America
Description: Selected by Dan Hinkley of Herronswood Nursery, WA, from a specimen at SF Botanical Garden (then Strybing Arboretum). He says of the plant "I first observed this species in the collections of Strybing Arboretum, blossoming beautifully in mid-February, and thought it to be amongst the best forms of our native currant I had seen, with very long, pendulous racemes of rich rose-pink flowers held on upright, rather narrow specimens to 6 feet or taller. It blossoms a month later in the Puget Sound area, but well worth the wait. This [Strybing Pink] is our name for this clone, in honor of a remarkable arboretum." (Herronswood Catalog 2005.)
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked in Herronswood 2005 catalog 1/23/2007. Plants previously called cv. 'Strybing's Best' in internal records. Accession number of source plant not cataloged at time of selection. Terry Seefeld believes the plants were in beds 34F & 34C. Don suggests they were from 48G-I. Probably uncataloged self-sown plants, but further research needed.

Notes

5/24/2011 Mona Bourell	Plant in 38B determined not to be 'Strybing Pink' [see note from 10/3/2006]. This record is being deaccessioned. Plant in 38B is now Ribes sanguineum var. glutinosum
8/2/2007 Mona Bourell	Terry reports 2 dead in 34B. Not in records previously from 34B.
10/3/2006 Mona Bourell	The plants in 0A3 are not 'Strybing Pink'. They are cuttings from old established plants of Ribes sanguineum glutinosum in bed 38B that apparently were never accessioned. Delete location for this record.
9/27/2006 Mona Bourell	Jeanne & Mona found 3 in 0A3 during inventory 9/26/2006. Terry describes as "late blooming"
2/1/2005 Geoff Smick	Terry planted 2 out from nursery to 38B, updated location record.
1/6/2005 Geoff Smick	This taxa originally grown at Strybing, collected by a Heronswood affiliate, named 'Strybing Pink' by them, then received again at Strybing from Heronswood.

Ribes sanguineum var. glutinosum 'Tranquillon Ridge' !

Grossulariaceae

INFO

Common Name: Flowering Currant, blood currant, pink-flowering currant
Perennial Shrub
Height: 10ft. Spread: 10ft.
Flowers Pink
Description: This large selection--10' x 10'--comes from a plant found on Tranquillon Ridge in Santa Barbara. Dark pink flower buds open into medium pink flowers. Does best with some shade. Drought-tolerant on coast, some summer water inland.

Selection from Tranquillon Ridge in Santa Barbara, under bishop pines. Introduced by native Sons Nursery
Cultivation: Best with some shade even in coastal gardens where it's drought tolerant. Occasional deep waterings are best in hot inland areas. Berries attract many birds including grosbeak and mockingbirds.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Spelling checked in google search 1/18/2006.

Ribes thacherianum Grossulariaceae !

INFO
Common Name: Santa Cruz Is gooseberry
Perennial Shrub
Flowers Red & white
Native Range: Santa Cruz Island
Synonomy: Ribes menziesii var. thacherianum
Description: Plants 1-2.5 m. Stems erect, densely white soft-pubescent; spines at nodes absent or 1-3, 4-8 mm; prickles on internodes scattered, glandular and eglandular. Leaves: petiole 1-2 cm, copiously white-pilose; blade oblong to roundish, shallowly 5-lobed, cleft 1/4 -1/3 to midrib, 2-3 cm, base truncate, surfaces soft-pubescent abaxially, subglabrous adaxially, lobes rounded, margins coarsely crenate-dentate, apex rounded to acute. Inflorescences pendent, solitary flowers or 2-flowered racemes, 2-4 cm, axis white-pilose. Pedicels not jointed, 6-8 mm, pilose; bracts broadly lanceolate, 2-3 mm, white-pilose. Flowers: hypanthium pinkish, narrowly tubular, 4-5 mm (1/2 as long as sepals), white-pilose, not glandular; sepals not overlapping, erect, pinkish, lanceolate, 9-10 mm; petals connivent, erect, white, oblong, inrolled, 4-6 mm; nectary disc not prominent; stamens 1.3 times as long as petals; filaments linear, 4-6 mm, glabrous; anthers white, lanceolate, somewhat sagittate, 3 mm, apex apiculate; ovary pilose, not glandular; styles connate nearly 3/4 their lengths, 9-11 mm, glabrous. Berries palatability not known, purple, subglobose, 7 mm, pilose-hairy with nonglandular spines.

Flowering Nov-Jul. Ravines in pine forests; 0-700 m; Calif.

Ribes thacherianum is known only from Santa Cruz Island, Santa Barbara County. The indehiscent part of the anther is short and dark.

Ribes viburnifolium Grossulariaceae !

INFO
Common Name: Catalina currant
Perennial Shrub
Flowers Reddish brown
Native Range: Calif: Channel Is - Baja Calif.
Description: Plants evergreen, 0.5-1 m. Stems erect or arched (no short shoots), with white, sessile, resinous glands; spines at nodes absent; prickles on internodes absent. Leaves: petiole 0.3-1 cm, strigillose and with yellow or white, sessile glands; blade ovate to obovate, unlobed, 2-4 cm, base truncate, margins shallowly toothed, sometimes undulate, apex rounded, surfaces with yellow, sessile glands abaxially, glabrous adaxially. Inflorescences erect, 6-15-flowered racemes, 1.5-5 cm, axis glandular, flowers evenly spaced. Pedicels jointed, 2-5 mm, glandular; bracts narrowly lanceolate, 2-3.5 mm, glandular. Flowers: hypanthium reddish, turbinate, 2-5 mm, glabrous, sessile-glandular; sepals not overlapping, spreading, reddish, triangular to broadly deltate-ovate, 2-3 mm; petals widely separated, erect, reddish brown, oblong to oblong-obovate, not conspicuously revolute or inrolled, 2 mm; nectary disc prominent, reddish to reddish brown, 5-angled, completely covering top of ovary; stamens nearly as long as petals; filaments linear, 2 mm, glabrous; anthers white, oval, 0.1 mm, apex with small cuplike depression; ovary sparsely sessile-glandular; styles connate 1/2 their lengths, 1 mm, glabrous. Berries palatable, red, globose, 5-6 mm, glabrous. 2n = 16.
Flowering Feb-Apr. Chaparral; 30-600 m; Calif.; Mexico (Baja California).

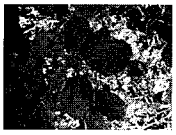

image of © 2010 Mona Bourell, SFBG1981-0228

Ribes viburnifolium is native on Santa Catalina Island and in northwestern Baja California. It is commonly cultivated; a population from a planting in San Clemente Canyon, Orange County, persists. Reports of populations in seemingly natural areas in Panama are unconfirmed. The leathery leaves are borne on long shoots, and the entire plant has a spicy, resinous fragrance.

Ribes viburnifolium 'Spooner's Mesa' Grossulariaceae !

INFO
Common Name: San Diego Evergreen Currant
Perennial Shrub
Height: 3-4ft. Spread: 6ft.
Flowers Pink Winter - Spring
Not Invasive
Description: An open wide spreading evergreen shrub that grows 3-4 feet tall and spreads to 6 feet. Dark red stems bearing fragrant leathery dark green leaves arch up and our from the center of the plant. Rose pink flowers bloom in late winter to mid spring. Plant in sun or light shade along coast to shade inland. Requiring little supplemental water, this native shrub is a good candidate for planting underneath an oak canopy. Drought tolerant. This variety has larger leaves giving the plant a fuller and denser appearance. Collected in on Spooner's Mesa (southern San Diego County) along the Tijuana River estuary near to Mexican border by Dylan Hannon.
Cultivation: Sun or Shade, good for live oak underplanting. Drought Tolerant with low water needs once established. Winter hardiness: 15-20° F
Record Notes: Scientific name checked in ITIS 2004-07 -19. Cultivar name appears on San Marcos Growers website 6/22/2005.

Ricinus communis Euphorbiaceae !

INFO
Common Name: castor oil plant
Perennial Herbaceous
Native Range: Mediterranean Basin, Eastern Africa, India
Description: Herbs erect, often single-stemmed but sometimes bushlike or treelike, 2-5(-10) m tall; younger parts glaucous, whole plant often reddish or purplish. Stipules connate, 2-3 cm; petiole 20-40 cm; leaf blade palmately 7-11-lobed, 30-50(-100) × 30-50(-100) cm, margin serrate. Inflorescence to 30 cm. Male flowers: pedicels 5-17 mm; calyx lobes 5-8 × 3-5 mm; stamens 7-8 mm. Female flowers: pedicels 5-10 mm; sepals ca. 5 mm; styles 2-5 mm. Fruiting pedicel to 45 mm; capsule ellipsoid or ovoid, 1.5-2.5 cm, echinate, spines to ca. 5 mm, sometimes smooth. Seed 7-12 mm, grayish, silvery, or beige with darker markings; caruncle depressed-conical, 2-3 mm wide. Fl. Jun-Sep, or Jan-Dec.

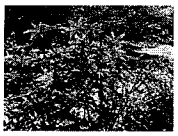

image of © 2011 Mona Bourell, SFBG2011-0066

image of © 2011 Mona Bourell, SFBG2011-0066

Cultivated, ruderal weed, sometimes naturalized in riverbeds; below 100-500(-2300) m. Cultivated and weedy worldwide.

The seeds yield castor oil, used medicinally and as an industrial lubricant. The seeds are highly toxic.

Robinsonella cordata — Malvaceae !

INFO Common Name: heartleaf robinsonella, blue hibiscus
Perennial Tree
Height: 20-30ft. Spread: 20-30ft.
Flowers Lavender-blue Mar, Apr, May
Native Range: Mexico - Guatemala
Synonomy: Rebsamenia arborea
Description: A slender deciduous gray barked tree to 40 feet tall with 2 to 4 inch long leaves that are heart shaped with a acuminate tip and covered with dense fuzzy hairs on the undersides. In spring and sometimes into summer appear the very showy terminal sprays of 3/4 to 1 inch wide lavender-blue hibiscus-like flowers.

This tree is known from wooded or brushy ravines at 5,000 to 6,500 feet in southern Mexico and Guatemala - some report it as far north as Puebla, Mexico. Robinsonella is a genus of 14 species from South and Central America that was named in recognition of Benjamin Lincoln Robinson, Asa Gray Professor of Systematic Botany at the Gray Museum at Harvard .
Cultivation: Full sun, medium water
Record Notes: Name checked with Tropicos. 5/26/2011

Rodgersia aesculifolia Saxifragaceae !

INFO
Common Name:
Perennial Herbaceous
Native Range: Tibet, Myanmar, China
Description: Herbs 0.8-1.2 m tall. Rhizomes transversely elongating, columnar, 3-4 cm in diam., pale purple inside. Stems angular, subglabrous. Leaves palmately compound; petiole 15-40 cm, sheathlike and long hairy at base; leaflets 5-7, obovate to oblanceolate, 7.5-30 × 2.7-12 cm, herbaceous or thinly leathery, abaxially long pilose along veins, adaxially sparsely subsessile glandular hairy along veins, base cuneate and sessile, margin doubly serrate, apex shortly acuminate. Pleiochasium paniculate, ca. 26 cm; branches and pedicels white paleaceous hairy and sparsely glandular hairy. Sepals (4 or)5(or 6), spreading, subtriangular, 1.5 -2 × ca. 1.8 mm, abaxially and marginally pilose and shortly glandular hairy, adaxially glabrous or subsessile glandular hairy, veins arcuate and pinnate, not or partly to completely confluent at apex, apex shortly acuminate. Stamens 1.2-2.6 mm. Ovary subsuperior, ca. 1 mm; styles 2, 0.8-1 mm. Capsule ovoid, rostrate. Seeds many, brown, fusiform, 1.8-2 mm. Fl. and fr. May-Oct. 2n = 60.

Native habitat: Forests, forest margins, scrub, meadows, rock clefts; 1100-3800 m. SE Gansu, ?Hebei, W Henan, W Hubei, S Ningxia, Shaanxi, Sichuan, Xizang, Yunnan [Myanmar].

Taxon Family Spelling Checked

Rodgersia henrici Saxifragaceae !

INFO
Common Name: bronzeleaf rodgers flower
Perennial Herbaceous
Height: 3-4ft.
Flowers White
Description: Very bold, handsome foliage that is purple when just emerging, then dark green, and resembles the palmate leaves of a horse chestnut tree. Creates a very dramatic effect when planted with hostas and astilbes. Whitish flowers in summer.
Cultivation: Requires a moist site and partial shade, but will tolerate some sun if the area is kept perpetually moist.
Record Notes: Name checked in IPNI 11/10/2005, M. Bourell.

ACCESSION **SFBG# 2005-0647 DEACCESSIONED** Rec'd: 11/9/2005

Rodgersia pinnata Saxifragaceae !

INFO
Common Name:
Perennial
Native Range: China
Description: Herbs 25-150 cm tall. Stems glabrous. Leaves subpinnately compound; petiole 3.5-32.5 cm, base brown long pilose. Basal and proximal cauline leaves usually with 6-9 leaflets, among which terminal ones 3-5, verticillate ones 3 or 4; distal cauline leaves with 3 leaflets; leaflets elliptic or oblong to narrowly obovate, 6.5-32 × 2.7-12.5 cm, abaxially brown pilose along veins, adaxially glabrous or strigose, base gradually narrowed, margin doubly serrate, apex acuminate. Pleiochasium paniculate, 12-31 cm, many flowered; branches 3.5-22 cm, paleaceous hairy, sometimes also shortly glandular hairy; pedicels 1.5-3.5 mm. Sepals 5, subovate, 2-2.7 × ca. 2 mm, leathery, abaxially tawny pilose and subsessile glandular hairy, adaxially sparsely subsessile glandular hairy near base, veins 3, arcuate, confluent at apex, apex shortly acuminate. Petals absent. Stamens 10, 2.8-4 mm. Carpels 2, ca. 3 mm, connate at base; ovary subsuperior; styles 2. Capsule purple, ca. 7 mm. Fl. and fr. Jun-Aug. 2n = 60*, ca. 75*.

* Forests, forest margins, scrub, shaded grassy slopes, alpine meadows, rock clefts; 2000-3800 m. Guizhou, E and S Sichuan, Yunnan.

Leaves glabrous adaxially
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

ACCESSION

SFBG# 2006-0600 Rec'd: 1/1/2000

Source: Taylor Neal-Quedensley
Orig. Qty: 1
Material: unknown
Intended for use in: Dry Mexico

Determined by Taylor Neal-Quedensley 9/25/2006
Wild Collected by Taylor Neal-Quedensley; 1 January 2000 Unknown, personal communication betw. Gardener 9 and Taylor. Only information is that it was probably collected in 2000..

LOCATION

Bed 49I - Nurserymen's Garden, border of Dry Mexico. Qty:1 Pl:9/25/2006
Ckd:3/24/2009 Mona Bourell
At path across from 50H; E of R. schaffneri and R. petasitis.

Notes

3/25/2009 Mona Bourell — Personal communication with Taylor, ID needs to be verified when it flowers.

12/13/2008 Mona Bourell — Mario Veliz [Guatemala] determined this to be Roldana chapalensis. Formerly in records as Roldana sp.

10/10/2006 Mona Bourell — Established plant in bed 49I. Gardener Bead 9 consulted with Taylor Neal-Quedensley in Aug 06, who confirmed ID [Roldana sp.], but only information he could add was that it was probably wild collected in 2000.

10/10/2006 Mona Bourell — Roldana use to be Senecio:. Tag says TNQ, but no coll. #. According to Quedensley's notes, he collected two Senecio in Guatemala. One is accessioned (coll # 01-030, acc. # 2003-0498) the other is not accessioned (01-036). This specimen may be one of these, but unsure which this is so creating new record for now.

Roldana heterogama

Asteraceae !

INFO

Common Name:
Perennial Herbaceous
Flowers Yellow
Native Range: Central America
Synonymy: Cacalia heterogama Benth.

Description: Leaves perfoliate.

Stems covered with conspicuous purple red hairs.

Plants arching and trailing, wide spreading easily.
Record Notes: Name checked with The Plant List on 5/15/2012 by Mona Bourell.

12/13/2008 Mona Bourell	Taylor and Mario Veliz determined this to be Roldania lanicaulis. Probably same accession as 1987-0282. Previously in record as Roldana sp.
3/7/2008 Mona Bourell	Taylor Neal-Quedensley determined that this plant in 29E is neither Senecio thomasii, nor Roldana barba-johannis and should be tagged Roldana sp. New sign/tag ordered.

Taxon Family Spelling Checked

Roldana oaxacana

Asteraceae !

INFO
Common Name:
Perennial Shrub
Height: 6-8ft.
Flowers Yellow Nov, Dec
Native Range: S. Mexico - Guatemala
Description: Large round purple or green fuzzy foliage on a dramatic 8' plant with yellow daisy bloom. The Roldana can be cut back if they get too big. At one time called Senecio cristobalensis.
Grantham & Mahonia, Pac Hort. 1999: Grown at SFBG since 1991. Endemic to the mountains of Chiapas, Mexico, it grows at elevations from 500 to 6000' or more in montane rain forest, cloud forest and pine-oak forest with such plants as alders and liquidambar. It grows as a shrub or giant herb from 3 to 15' in height. The color of the flower heads may vary from white to yellow, but the form in cultivation bears orange flower heads in late fall and winter. Bold foliage and a vigorous habit mark this outstanding plant. A velvety down of pruple-magenta hairs covers the underside of mature leaves that are 18" across, the robust stems, and all parts of the new leaves. The upper surface of mature leaves is of a rich green hue.
Record Notes: Name checked with The Plant List on 4/30/2012 by Mona Bourell.
Acc 1999-0793 originally received as Roldana aff. cristobalensis. R. cristobalensis is a synonym.

Taxon Family Spelling Checked

Romneya 'White Cloud' — Papaveraceae !

INFO
Common Name:
Perennial Shrub
Height: 10ft.
Parentage: Romneya coulteri x R. trichocalyx
Description: 'White Cloud', is distinguished by its vigor, heavy flower production and huge flowers.
Cultivation: For best growth, Romneya coulteri should be situated in sunny locations. Plant only in well drained, infertile soils similar to the native washes. An excellent plant for erosion control, which it should be considered for steep slopes. Difficult to transplant, Matalija poppy is particular about minimal root disturbance. Great care should be taken to avoid exposing or damaging the root system.
Propagation: The propagation of this species is quite difficult. This accounts for the limited availability in retail nurseries. Several methods of seed propagation are found in the literature regarding Romneya, including surface sowing of the seed in well drained sand mixtures covered by bell jars or placing pine straw on top of the seed and setting afire. The use of cuttings or the air layering may be easier than the arduous task of seed propagation. Regardless of the process, make sure the plants are well established prior to attempting the transplant. Remember the root system is quite delicate.
Record Notes: Cultivar name checked in web search 3/10/2004. Updated name from Romneya coulteri 'White Cloud' to Romneya 'White Cloud', as parents (R. coulteri, R. trichocalyx) are now considered two distinct species (per Jepson Manual) 8/31/2006 TM.

ACCESSION **SFBG# 1988-0430 DEACCESSIONED** Rec'd: 12/2/1988

LOCATION

Bed 40F - California Qty:~ Pl: Ckd:8/4/2009 Mona Bourell & Terry Seefeld
Mixed with Salvia munzii in central part of bed at N & S paths; #16 on bed inventory map. Interpretive sign present.

Notes

4/12/2011 Mona Bourell — Interpretive sign installed in 40F.

8/31/2006 Tony Morosco — Examination of plants in flower and bud shows that these plants have characters consistant with a hybrid between R. coulteri and R. trichocalyx. Buds: sparsely coarse hairy, petals 10-15 cm. Leaves 12-15 cm. Could not find published description of R. 'White Cloud' but assuming these plants are that cultivar. These plants are probably = 1991-1186, which was

3/19/2004 Tony Morosco — Plants listed in nursery are cuttings from plants in bed 40F, but accessioned in error- intended for plant sale, not gardens. Removed location record.

3/10/2004 Tony Morosco — Accession tags made for plants.

3/10/2004 Tony Morosco — Plant in bed 40F, but no records of any Romneya ever being planted in this bed. Alek Koomanoff indicates that this might be Romneya coulteri 'White Cloud' but no evidence to back this identification at this time.

Taxon Family Spelling Checked

Romneya coulteri

Papaveraceae !

INFO

Common Name: Coulter's Matilija poppy, Poached Egg Flower, Californian Tree Poppy
Perennial Shrub
Height: 8ft.
Native Range: Southern California
Description: This beautiful member of the poppy family has grey-green leaves which are pinnate (leaflets arranged on each side of a central stalk) and large, white solitary flowers which are scented and have 4-6 petals and many rich yellow stamens. Along the upper part of the thick gray-green stems are displayed huge (up to 9" across) slightly scented white, crepe-papery, "poppy" flowers with glossy, yellow stamens. Bloom season is from late Spring to Summer (or Fall if watered).

Plants 10-25 dm. Leaves 5-20 cm. Flowers: calyx distinctly beaked at bud apex, glabrous; petals 6-10 cm. Capsules 3-4 cm. Seeds dark brown, papillose. 2 n = 38.

Flowering spring-summer (Apr-Aug). Dry washes, canyons; less than 1200 m; Calif.

Romneya coulteri shares with Hibiscus lasiocarpos the distinction of having the largest flowers of any plant native to California.

Rorippa nasturtium-aquaticum — Brassicaceae !

INFO
Common Name: water cress
Perennial Herbaceous
Flowers White Mar, Apr, May, Jun, Jul, Aug, Sept, Oct, Nov
Native Range: Europe - Central Asia
Synonomy: Nasturtium officinale R. Br, Nasturtium nasturtium-aquaticum (L.) Karsten, Sisymbrium nasturtium-aquaticum L.

Description: Perennial, ± glabrous, semi-aquatic, naturally occurring along streams, springs, marshes, lake margins.

Stem submersed, ± floating, or prostrate on mud, 1–6 dm, rooting at nodes
Leaves many, 1-pinnate; leaflets generally 3–7, widely oblong to ovate, ± entire or wavy-margined
Flower: petals 3–4 mm, white
Fruit spreading to ± erect, 10–15 mm, narrowly oblong, straight to upcurved; pedicels ± spreading, ± straight, not bracted, junctions not flat, lower 8–15 mm; style < 0.5 mm or 0
Seeds 2 rows per chamber, ± 1 mm wide, ± round

Widely cultivated for edible greens.

Record Notes: Name checked iwth IPNI and Jepson Manual, 2/2/2008.

Rosa 'Betty Prior' — Rosaceae X

INFO
Common Name: floribunda rosa
Perennial Shrub
Height: 2.5-5ft.
Flowers Carmine pink
Description: This rose produces single, carmine-pink, slightly fragrant blooms nonstop from June until frost. It grows 2.5 to 5 feet high and wide.
Noteworthy characteristics: Modern Floribundas are grown for their many clusters of everblooming single or double flowers. They form upright, disease-resistant shrubs, making them ideal for borders or hedges.

Cultivation: Grow in fertile, moist, well-drained soil in full sun or partial shade. Provide good air circulation and remove fallen leaves to help prevent disease. In late winter or early spring, prune hard (back to 10-18 inches) and reduce sideshoots to 2 or 3 buds. To renovate, prune one in three stems close to the base.
Propagation: Take softwood cuttings when bloom initiates in spring to summer; take hardwood cuttings in fall.

Record Notes: Name checked on 9/27/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Rosa 'Comtesse de Cayla' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-4ft.
Flowers Pink-orange
Description: A hybrid tea-china rose with smaller china rose foliage but tea flowers. The flowers are loose and slightly nodding. The most appealing feature of Comtesse du Cayla is surely the coppery pink coloration of its blooms. The color is not flat, but a unique blend of copper, pink, and salmon.

Rosa 'Cramoisi Superior' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 5ft. Spread: 5ft.
Flowers Red
Synonomy: Rosa 'Agrippina'
Description: "China roses" are twiggy, smooth-wooded , compact , short
plants (three to four feet at maturity in the bush form) that seem to be in bloom constantly. The blooms are predominately red or white and have been in cultivation since the early 1800's.

Rosa 'Cramoisi Superior', a China rose is a climbing or rounded twiggy shrub form, semi-double 2 inch red blossoms. Believed to be developed in France by Coquereau in 1832.
Nearly everblooming. Use as a specimen or tall "Climber". Train along a fence. The rich crimson flowers are fully double and cupped form. Fruity fragran
Cultivation: Incredible performer in every respect. Vigorous,disease resistant.
Record Notes: Cultivar name found used in the trade with internet search, 12/1/2009.

Rosa 'Flutterbye' — Rosaceae !

INFO
Common Name:
Perennial Shrub/climber
Flowers Multicolor yellow, coral, tangerine and pink, Oct, Sept
Parentage: one is Rosa mutabilis.
Description: Flutterbye is a new favorite of ours. We love it for its ever changing subtle colors and continuous bloom above disease-free foliage. Golden yellow buds tipped in rose pink open to bright yellow and fade to pale pink. It greatly resembles Rosa mutabilis, which is one of its parents. It is short for a climber, and is best suited to fences, trellises and low shrubs.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 10/25/2007.

Rosa 'Galaxy' Floribunda — Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-4ft.
Flowers Yellow blend
Synonymy: Rosa 'Meihuterb'
Description: Additional cultivar information: (aka MEIhuterb)
Hybridized by Meilland; Year of Registration or Introduction: 1995

Class:
Cluster-flowered (incl. Floribunda & Grandiflora)

Bloom Shape:
Double

Flower Fragrance:
Slightly Fragrant

Bloom Time:
Late Spring/Early Summer
Blooms repeatedly
Record Notes: Cultivar name found used in the trade with Internet search, 4/10/2012 by Mona Bourell.

Rosa 'Louis Philippe' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-5ft. Spread: 3ft.
Flowers Red Apr, May, Jun,
Description: Glowing, double, cup-like blossoms of deep crimson with a touch of blush begin in spring, continuing all summer long and into fall. Blemish-free foliage and a dreamy, soft, sweet fragrance add up to a very fine Rose, and one of my personal favorites. Shrubby in form, this everblooming China Rose would make a fabulous hedge (a sensory delight!), a fine single specimen, or would work well mixed in the company of perennials. Grows 3-5' tall and is hardy to 10 degrees F.
Bloom color: Red
Bloom period: summer

Zones: 7-9

Record Notes: Cultivar name found used in the trade with internet search, 4/9/2008.

Rosa 'Louise Odier' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 6ft. Spread: 4ft.
Flowers Pink Mar, Apr, May, Sept, Oct, Nov
Description: 'Louise Odier,' bred in France and introduced in 1851, has camellia-like, pink blooms. Like other Bourbons, a class of old garden roses, it can achieve great stature in the garden, reaching up to 6 feet in height. Bourbons' wide-ranging habit makes them suitable for growing up pillars or training on walls, and they produce fragrant blooms in spring and again in fall.
Fragrant.
Light gray green leaves; double flower, camellia shaped rosette.

Rosa 'Lyda' — Rosaceae !

INFO
Common Name:
Perennial Shrub
Flowers White, Pink
Description: Bred by Kleine Lettunich from `Francis E. Lester'. Named for her daughter and the song from The Music Man. The white blooms edged with lavender-pink have an ethereal appearance and the wonderful fragrance can be enjoyed even several feet from the bush. The apple-blossom-like 2" blooms (petals 5) appear in profusion on a spreading (petals 5) plant with rich green, disease resistant foliage. Will bloom profusely in shade.

Rosa 'Margaret Merrill' — Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 5ft. Spread: 2-4ft.
Flowers White
Description: White, near white or white blend Floribunda.
Registration name: HARkuly
Exhibition name: Margaret Merril
Bred by Harkness (United Kingdom, 1977).
Introduced in United Kingdom by Harkness & Co. Ltd. in 1978 as 'Margaret Merril'.
Floribunda.
White or white blend, pink center. Strong, citrus, spice fragrance. 18 to 29 petals. Average diameter 4". Large, semi-double (9-16 petals), high-centered bloom form. Blooms in flushes throughout the season.
Height of 30" to 5' (75 to 150 cm). Width of 2' to 4' (60 to 120 cm).
USDA zone 6b through 10b. Disease susceptibility: susceptible to blackspot . Spring Pruning: Remove old canes and dead or diseased wood and cut back canes that cross. In warmer climates, cut back the remaining canes by about one-third. In colder areas, you'll probably find you'll have to prune a little more than that. Requires spring freeze protection (see glossary - Spring freeze protection) . Can be grown in the ground or in a container (container requires winter protection).
seed: Rudolph Timm × Dedication
pollen: Pascali ®

Rosa 'Nozomi' Rosaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pink
Description: Nozomi' is a popular ground cover rose, one of the first to catch everyone's imagination and it is now grown in landscaping projects everywhere. But it is more than just robust and trouble-free: the small, double pearly pink flowers stand out well against the lush dark foliage and are produced in huge quantities in mid-summer. It deserves to be used as a feature plant, growing in an ornamental tub, for example, or cascading down a bank or over a wall. The stems may be pegged down to the ground to increase coverage, and plants are often grafted as weeping standards. The only pruning needed is a trim in late winter or early spring if the plant is beginning to exceed its allotted area. The Royal Horticultural Society has given it its prestigious Award of Garden Merit (AGM).

Notes

Rosa 'Ralph's Creeper' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 1-2ft. Spread: 3-5ft.
Flowers Orange, Red, Yellow
Description: This repeat-flowering ground cover rose is a great choice for containers, garden banks and as a large scale groundcover as it grows to only 1 to 2 feet high by 3 to 5 feet wide. The plant has small healthy dark green foliage and bears sprays of up to 15 semi-double flowers that are deep orange-red with a yellow center and have a moderately strong apple blossom fragrance. This modern hybrid was created by Ralph Moore, the legendary California miniature rose hybridizer, by crossing 'Papoose', a Climbing Miniature (1955) with 'Playboy', a Cluster-flowered Floribunda (1976). '
Cultivation: Ralph's Creeper' is a durable rose that tolerates shade and occasional hard pruning - we've heard of people that use a lawnmower top keep it low!
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked in San Marcos Nursery website 3/7/2005.

Rosa 'Rise and Shine' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 1.5ft.
Flowers Yellow
Description: Deep yellow Miniature.
Registration name: Rise 'n' Shine
Bred by Ralph S. Moore (United States, 1977).
Miniature.
Deep yellow. Strong, rose, tea fragrance. 25 to 40 petals. Average diameter 1.5". Very large, double (17-25 petals), borne mostly solitary, in small clusters, in large clusters bloom form. Prolific, continuous (perpetual) bloom throughout the season.
Medium, bushy, rounded, upright, well-branched. Small, semi-glossy, medium green, dense foliage.
Height of 16" to 20" (40 to 50 cm).
USDA zone 4b through 11. Can be used for beds and borders, container rose, cut flower or garden. Hardy. vigorous. Spring Pruning: Remove old canes and dead or diseased wood and cut back canes that cross. In warmer climates, cut back the remaining canes by about one-third. In colder areas, you'll probably find you'll have to prune a little more than that. Requires spring freeze protection (see glossary - Spring freeze protection) . Can be grown in the ground or in a container (container requires winter protection). Can be pruned to maintain a shorter habit.
United States - Patent No: PP 4,231 on 28 Mar 1978 VIEW USPTO PATENT
Application No: 805609 on 10 Jun 1977
Inventor: Moore, Ralph S. (Visalia, California)... rich deep yellow color... Parentage: 'Little Darling' (USPP001581) x 'Yellow MAgic'. Variety name: 'Rise 'n Shine'.
Little Darling × Yellow Magic (miniature, Moore 1970)
According to the New Zealand Plant Variety Rights (PVR) web page, application for a PVR Grant for this rose was made May 1, 1978 and granted March 25, 1980 (PVR Grant No. 69). The breeder's Reference for this rose is Rise n Shine. This PVR Grant was canceled May 25, 1981.

Rosa 'Schoener's Nutkana' Rosaceae !

INFO
Common Name:
Perennial Shrub
Parentage: Rosa nutkana x R. 'Paul Neyron'
Description: 'Schoener's Nutkana' is a rose variety named after Father Georg Schoener, a priest who became a notable rose breeder, who developed this rose in 1930 as a cross between Rosa nutkana and Rosa 'Paul Neyron'.

This variety is a shrub rose, with single rose flowers, five-petalled but sometimes with another one or two, deep pink in color with a large circle of yellow stamens. The plant tends to be a sprawling shrub, with very few thorns on the stems and small light green leaves.

Rosa 'Snow Goose' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 8-10ft.
Flowers White
Description: Category Climbing and Rambler Roses (Rambler Roses)
Bred By David Austin
Colour White
Flower Type Double/Full Bloom
Size Tall Shrub
Short Rambler

A short, repeat flowering rambler growing to 8 to 10 ft. It bears sprays of small white pompon flowers, well filled with narrow petals, which gives them a slightly daisy-like appearance. The stems are relatively thornless and straight but they are still easy to train over an arch or across a wall, fence or trellis. Very disease-free and reliable.

The blooms are closely packed with shiny white petals are of slightly uneven lengths, creating a daisy-like effect. There is a sweet musk rose fragrance.

It has, attractive, slender green leaflets.

Sweet musk fragrance.

Cultivation: Snow Goose may be used to scramble over shrubs or hedges as it will provide flushes of pompons after the shrubs have finished flowering.

It also performs beautifully as a ground cover rose, due to its long, lax growth. When smothered in bloom, it gives the effect of freshly fallen snow.
Record Notes: Name checked with The Plant List on 3/29/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Rosa 'Souvenir du Dr. Jamain' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 5-10ft. Spread: 3ft.
Flowers Violet to dark red
Description: Dark red Hybrid Perpetual.
Registration name: Souvenir du Docteur Jamain
Bred by François Lacharme (France, 1865).
Hybrid Perpetual.
Violet to dark red, red shading. Moderate fragrance. Medium, double (17-25 petals), cupped bloom form. Blooms in flushes throughout the season.
Thornless (or almost).
Height of 5' to 10' (150 to 305 cm). Width of 3' (90 cm).
USDA zone 4b and warmer. Plant in partial shade for best color. Feed this rose well.
Général Jacqueminot (hybrid perpetual, Roussel, 1853) × Charles Lefèbvre
Some disagreement about parentage (See References).
Cultivation: USDA zone 4b and warmer. Plant in partial shade for best color. Feed this rose well.

Rosa aff. davidii Rosaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pink
Native Range: China
Description: Shrubs 1.5–4 m tall. Branchlets spreading, terete, slender, glabrous; prickles sparse to scattered, triangular, straight or slightly curved, flat, gradually tapering to broad base. Leaves including petiole 7–14 cm; stipules mostly adnate to petiole, free parts ovate, margin glandular, apex apiculate; rachis and petiole puberulous, glandular-pubescent, sparsely shortly prickly; leaflets 7–9, rarely 11 or 5, 2.5–7 × 1–2(–3) cm, abaxially densely puberulous or sparsely pubescent, rarely glabrous, adaxially usually glabrous, base subrounded or broadly cuneate, margin acutely simply serrate, apex acute. Flowers 3 to numerous in corymb, 2–3 cm in diam.; pedicel 1.5–2.5 cm, pubescent and stipitate glandular, glands to 3 mm; bracts large, ovate or lanceolate, both surfaces puberulous, margin entire, apex acuminate. Hypanthium elliptic or long ovoid, densely stipitate glandular. Sepals 5, ovate, leaflike, both surfaces puberulous, abaxially glandular-pubescent, margin entire. Petals 5, deep pink, broadly obovate, base broadly cuneate, apex emarginate. Styles free, slightly exserted, shorter than or nearly equaling stamens, densely pubescent. Hip deep red or orange-red, long ellipsoid or long obovoid, 1–1.5 × 1.8–2.5 cm, with a long neck at apex, glandular-pubescent or not, with persistent, erect sepals. Fl. Jun–Jul, fr. Sep.

Forest margins, scrub; 1500–3000 m. Gansu, Ningxia, Shaanxi, Sichuan, Yunnan.

Record Notes: Species name checked with Flora of China, 2/2/2009.

Native Range: China
Description: Shrubs 1–3 m tall. Branchlets terete, slender; prickles scattered, terete, straight or slightly curved, to 1 cm, abruptly tapering to base; old branches often densely bristly. Leaves including petiole 4–11 cm; stipules broad, mostly adnate to petiole, free parts ovate, glabrous, margin glandular serrate, apex acute; rachis and petiole glabrous or sparsely pubescent, prickly, or sparsely glandular and shortly prickly; leaflets 7–9, rarely 5; elliptic, ovate, or oblong, 1–3 × 0.6–2 cm, glabrous or abaxially along veins sparsely pubescent and glandular-pubescent, base subrounded, margin simply serrate, apex acute or rounded-obtuse. Flowers solitary, or 2 or 3 and fasciculate, 2–5 cm in diam.; pedicel 5–10 mm, stipitate glandular-pubescent or not; bracts ovate-lanceolate, glabrous, margin glandular serrate, apex acuminate. Hypanthium ellipsoid-ovoid. Sepals 5, ovate-lanceolate, leaflike, abaxially stipitate glandular, adaxially densely pubescent, margin entire. Petals 5, pink, obovate, base cuneate, apex emarginate. Styles free, much shorter than stamens, densely villous. Hip deep red, ellipsoid-ovoid, 1–1.5 cm in diam., with a short neck at apex, stipitate glandular or not, with persistent sepals. Fl. May–Jul, fr. Aug–Oct.

Scrub, bases of mountains, stream sides; ca. 1700 m. Hebei, Henan, Jilin, Nei Mongol, Shanxi.

Essential oils are extracted from the flowers, and the fruit are used to make jam. Both the flowers and fruit are used medicinally.

Rosaceae !

INFO

Common Name: Macartney rose
Perennial Shrub
Native Range: China
Description: Shrubs evergreen, diffuse, 0.5–3 m tall, with long repent branches. Branchlets purple-brown, terete, robust, tomentose; prickles often in pairs below stipules, straight to slightly curved, to 9 mm, flat, smaller prickles and glandular bristles often present and dense to scattered. Leaves including petiole 4–9 cm; stipules mostly free, or with base adnate to petiole, densely pubescent, margin pectinate, densely glandular-pubescent; rachis and petiole sparsely pubescent, glandular-pubescent and shortly prickly; leaflets 5–9, elliptic or obovate, 1–2.5 × 0.5–1.5 cm, leathery, abaxially glabrous or pubescent along veins, adaxially glabrous, shiny, base broadly cuneate or subrounded, margin crenate, apex truncate, rounded-obtuse, or slightly acute. Flowers solitary or 2 or 3 and fasciculate, 4.5–9 cm in diam.; pedicel less than 1 cm, densely villous, sparsely glandular-pubescent; bracts several, large, broadly ovate, abaxially densely tomentose, adaxially subglabrous, margin irregularly incised serrate, laciniate, or pectinate. Hypanthium depressed-globose, abaxially densely tawny pubescent and glandular-pubescent. Sepals 5, broadly ovate, abaxially densely tawny pubescent, adaxially sparsely pubescent, apex caudate-acuminate. Petals 5, white or yellowish white, obovate, base broadly cuneate, apex emarginate. Styles free, slightly exserted, slightly shorter than stamens, densely pubescent. Hip globose, 1.3–2.7 cm in diam., densely tawny pubescent, with persistent, reflexed sepals. Fl. May–Jul, fr. Aug–Nov.

Mixed forests, scrub, sandy hills, stream sides, seashores, roadsides; sea level to 300 m. Fujian, Guizhou, Hunan, Jiangsu, Jiangxi, Taiwan, Yunnan, Zhejiang [S Japan].

Taxon Family Spelling Checked

Rosa bridgesii — Rosaceae !

INFO
Common Name: pygmy rose
Perennial Shrub
Native Range: California - Oregon Mts.
Synonomy: R. gymnocarpa var. pubescens S. Watson
Description: Dwarf shrub generally 1–8 dm, rhizomed
Stem dark brownish; prickles few, generally paired, base thick, straight
Leaf: leaflets generally ± hairy and glandular; terminal leaflet generally 10–30 mm, generally widely obovate (elliptic), tip generally ± truncate, margins generally double-toothed, glandular
Inflorescence 1(–5)-flowered; pedicels generally ± 10–15 mm, glabrous to glandular
Flower: hypanthium generally 2.5–4 mm wide at flower, generally glabrous (glandular), neck generally 1.5–2 mm wide; sepals generally glandular, margins entire, tip generally < body, entire; petals 10–15 mm; pistils ± 5–20
Fruit 6–10 mm wide
Ecology: Open forests, rocky areas
Elevation: 900–2500 m.
Bioregional distribution: Cascade Range, Sierra Nevada
Distribution outside California: Oregon
Synonyms: R. gymnocarpa var. pubescens S. Watson

Rosa californica — Rosaceae !

INFO
Common Name: California wild rose
Perennial Shrub
Flowers pink May, Jun
Native Range: Western North America
Synonomy: Rosa aldersonii
Description: Shrub or thicket-forming, 8–25 dm.
Stem: prickles few to many, paired or not, 3–15 mm, thick-based and compressed, generally curved (straight).
Leaf: axis ± shaggy-hairy (± glabrous), hairs to 1 mm, glandless or glandular; leaflets 5–7(9), ± hairy, sometimes glandular; terminal leaflet generally 15–50 mm, ± ovate- elliptic, generally widest at or below middle, tip rounded to acute, margins single- or double-toothed, glandular or not.
Inflorescence: (1)3–30(50)-flowered; pedicels generally ± 5–20 mm, generally ± hairy, glandless.
Flower: hypanthium 3–5.5 mm wide at flower, glabrous to sparsely hairy, glandless, neck 2–4.5 mm wide; sepals glandular or not, entire, tip generally ± = body, entire; petals generally 15–25 mm, pink; pistils 20–40.
Fruit: generally 8–15(20) mm wide, generally (ob) ovoid; sepals generally erect, persistent; achenes generally 3.5–4.5 mm.
n=14. Generally ± moist areas, especially streambanks; < 1800 m. California Floristic Province (except High Cascade Range, High Sierra Nevada, Tehachapi Mountain Area); s Oregon, n Baja California. Variable; needs study. Feb–Nov
Record Notes: Name checked in ITIS. ITIS Database notes TSN=24818 useage as 'accepted'. 2004-07-19.

Rosa chinensis Rosaceae !

INFO
Common Name: Chinese rose
Perennial Shrub
Height: 6ft.
Flowers Red, pink, white, or purple
Native Range: China
Synonomy: Rosa montezumae
Description: Shrubs erect, 1–2 m tall. Branchlets purple-brown, terete, robust, subglabrous; prickles abundant to absent, curved, stout, flat. Leaves including petiole 5–11 cm; stipules mostly adnate to petiole, free parts auriculate, margin entire, often glandular-pubescent, apex acuminate; rachis and petiole sparsely prickly and glandular-pubescent; leaflets 3–5, rarely 7, greenish abaxially, dark green adaxially, broadly ovate or ovate-oblong, 2.5–6 × 1–3 cm, both surfaces subglabrous, adaxially often shiny, base subrounded or broadly cuneate, margin acutely serrate, apex long acuminate or acuminate. Flowers 4 or 5 and fasciculate, rarely solitary, slightly fragrant or not, 4–5 cm in diam.; pedicel 2.5–6 cm, subglabrous or glandular-pubescent; bracts 1–3, linear, glabrous, margin glandular or entire, apex acute. Hypanthium ovoid-globose or pyriform, glabrous. Sepals 5, deciduous, ovate, sometimes leaflike, abaxially glabrous, adaxially densely villous, margin entire or few pinnately lobed, rarely entire, apex caudate. Petals 5, semi-double or double, red, pink, white, or purple, obovate, base cuneate, apex emarginate. Styles free, exserted, nearly equaling stamens, pubescent. Hip red, ovoid or pyriform, 1–2 cm in diam., glabrous. Fl. Apr–Sep, fr. Jun–Nov. 2n = 21*, 28*.
Native in Guizhou, Hubei, Sichuan; also widely cultivated in China [widely cultivated elsewhere].

Notes

6/12/2001	Recieved as R. chinensis 'Mutabilis' Plant not found in Bed 74 on 6/12/01.

Taxon Family Spelling Checked

Rosa chinensis 'Mutabilis' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-6 [10]ft. Spread: 6ft.
Synonomy: R. 'Mutabilis', R. x odorata 'Mutabilis' , R. 'Tipo Ideale', R. turkestanica
Description: While it is considered a China rose, the origins of this hybrid are a mystery.
This China rose is a rounded, repeat-blooming, old garden shrub rose which grows 3-6' tall (typically to 3' in northern climates and taller in southern climates). Features clusters of slightly fragrant, single flowers (3" diameter) which bloom in May and repeat throughout the summer into fall. Flowers change color (mutate as the cultivar name suggests) as they mature, opening yellow and changing to orange, pink and finally deep pinkish-red. Thus, a shrub in full bloom will feature a wide spectrum of flower colors. Medium green foliage and red stems. Orange hips will form if spent flowers are not deadheaded. Sometimes called butterfly rose because of the purported resemblance of the open flowers to butterflies.
Cultivation: Grow in fertile, moist, well-drained soil in full sun or partial shade. Provide good air circulation and remove fallen leaves to help prevent disease. While dormant in late winter or early spring, prune lightly or back by up to 1/3, reducing side shoots by 1/2 to 1/3. To renovate, prune one in four or five shoots from the base.

Propagation: Take softwood cuttings when bloom initiates in spring to summer; take hardwood cuttings in fall.

Record Notes: Name checked with The Plant List on 1/30/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon Family Spelling Checked

Rosa minutifolia — Rosaceae X

INFO
Common Name: small-leaved rose, Baja rose, Ensenada Rose
Perennial Shrub
Height: 1-5ft. Spread: 30+ft.
Flowers Pink sporadic
Native Range: San Diego - Baja California
Synonomy: Hesperhodos minutifolia (Engelm.) Hurst.
Description: Rosa minutifolia is dramatically distinct. Gray stems bear many slender, straight prickles. Leaves are small by comparison, less than an inch long. Small pink flowers are borne solitary on the stems. The tiny leaflets (only about 1/4 in. long) of Rosa minutifolia are deeply incised, and the hips are densely prickly. The entire plant, which forms an impenetrable thicket, is so densely prickly that one of the discovers proposed horrida as an appropriate specific epithet. Known from only a single population in San Diego County (thus endangered in California), this rose is more abundant along the coast of Baja California.

Dense shrub ± 3–10 dm
Stem gray; prickles many, slender, straight
Leaf: leaflets hairy; terminal leaflet ± 3–6 mm, ± obovate, tip ± obtuse, margins toothed ± 1/2 to midvein, ± glandless
Inflorescence generally 1-flowered; pedicels ± 2–10 mm, hairy, glandless
Flower: hypanthium ± 3 mm wide at flower, densely prickly, neck ± 2 mm wide; sepals glandless, with toothed lateral lobes, tip generally ± = body, toothed; petals ± 10–20 mm; pistils generally ± 10
Fruit ± 5 mm wide
Ecology: Chaparral
Elevation: ± 160 m.
Bioregional distribution: s Peninsular Ranges (Otay Mesa)
Distribution outside California: n Baja California

Cultivation: Full sun, (good drainage?). According to Lenz (1982), five rooted cuttings planted at the Rancho Santa Ana Botanic Garden in 1954 had become "one large tangled mass" nearly 30 feet across by 1982, though the species is otherwise "an extremely rare plant" in horticultural circles. Although generally requiring a hot, dry climate (Krüssmann, 1981), plants are capable of surviving at least as far north as San Francisco (i.e., in the UC Botanical Garden)

Rosa moyesii — Rosaceae !

INFO
Common Name:
Perennial Shrub
Flowers Red
Native Range: China
Description: Shrubs 1–4 m tall. Branchlets terete, glabrous or sparsely puberulous; prickles absent or if present, paired below leaves, straight or slightly curved, to 5 mm, stout, flat, tapering below to broad base. Leaves including petiole 7–13 cm; stipules broad, mostly adnate to petiole, free parts long ovate, glabrous, margin glandular serrate, apex acute; rachis and petiole puberulous, glandular-pubescent, sparsely small prickly, leaflets 7–13, ovate, elliptic, or oblong-ovate, 1–5 × 0.8–2.5 cm, abaxially densely pubescent or only along prominent veins pubescent, adaxially glabrous, base subrounded or broadly cuneate, margin acutely simply serrate, apex acute or rounded-obtuse. Flowers solitary, or 2 or 3 and fasciculate, 4–6 cm in diam.; pedicel 1–3 cm, usually densely stipitate glandular, rarely glabrous; bracts 1 or 2, oblong-ovate, to 2 cm, margin glandular-pubescent, apex acute or acuminate. Hypanthium ovoid. Sepals 5, ovate, leaflike, abaxially glabrous or with a few glandular bristles at base, adaxially pubescent, pinnately lobed. Petals 5, deep red, broadly obovate, base broadly cuneate, apex emarginate. Styles free, shorter than stamens, pubescent. Hip purple-red or orange-red, globose-ovoid, to 5 cm, 1–2 cm in diam., with a short neck at apex, stipitate glandular, with persistent, erect sepals. Fl. Jun–Jul; fr. Aug–Oct.

Leaflets abaxially pubescent only along veins, rachis puberulous.

Native habitat: Scrub, slopes; 2700–3800 m. Shaanxi. Sichuan, Yunnan.

Record Notes: Name checked with Flora of China, 5/11/2010.

Rosa multiflora — Rosaceae !

INFO
Common Name: multiflora rose
Perennial Shrub
Flowers White
Native Range: Japan, Korea
Synonomy: Rosa cathayensis
Description: Erect branching shrub with prickles on the spreading rather stout usually glabrous branches and petioles; stipules green, membranous, short-pubescent and glandular-pilose, the free portion filiform at apex; leaflets 5-7, rather membranous, ovate, obovate or oblong, green, 2-4 cm. long, obtuse to acute, dull, nearly glabrous on upper side, paler and usually with short soft pubescence beneath, the petioles short-pubescent; panicles many-flowered, erect; flowers white, 2-3 cm. across, the pedicels often with short stipulate glands.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=24833 useage as 'accepted'. 2004-07-19.

Rosa nutkana var. nutkana — Rosaceae !

INFO
Common Name: Nootka Rose
Perennial Shrub
Native Range: Western North America
Description: Shrub, loose to thicket-forming, generally 5–20 dm
Stem generally ± black; prickles few–many, generally ± compressed, ± straight
Leaf: leaflets sparsely hairy and glandular; terminal leaflet ± 15–50 mm, ± widely elliptic, base generally ± rounded, tip ± obtuse, margins ± single- to double-toothed, ± glandular
Inflorescence generally 1(–4)-flowered; pedicels generally ± 10–20 mm, glabrous or glandular
Flower: hypanthium generally 5–7 mm wide at flower, glabrous or glandular, neck 3–6 mm wide; sepals generally glandular, entire, tip generally > body, toothed; petals generally 18–25 mm; pistils > 10
Fruit 10–15 mm wide
Chromosomes: n=21
Ecology: Generally ± moist flats
Elevation: < 700 m.
Bioregional distribution: w Northwestern California
Distribution outside California: to Alaska
Synonyms: vars. muriculata (Greene) G.N. Jones and setosa G.N. Jones
May hybridize with coastal species to n Chl

Rosa pisocarpa — Rosaceae !

INFO
Common Name: cluster rose
Perennial Shrub
Flowers Pink
Native Range: California - Brit. Col.
Synonymy: Rosa pisocarpa var. rivalis, Rosa rivalis
Description: Shrub to thicket, generally 5–25 dm
Stem generally ± black; prickles few, generally ± thick-based, straight
Leaf: leaflets (sub)glabrous; terminal leaflet ± 15–40 mm, ± obovate-elliptic, tip ± obtuse, margins single-toothed, generally glandless
Inflorescence generally 2–10-flowered; pedicels ± 10–20 mm, generally glabrous, glandless
Flower: hypanthium generally 3–6 mm wide at flower, glabrous, neck 2–3 mm wide; sepals generally glandular, margins entire, tip generally > body, entire; petals ± 15–20 mm; pistils generally > 10
Fruit ± 10 mm wide
Chromosomes: n=7
Ecology: Generally ± moist or shady areas
Elevation: 30–2100 m.
Bioregional distribution: Northwestern California, Cascade Range
Distribution outside California: to British Columbia
Intergrades with R. californica , R. woodsii , R. nutkana

Cultivation: Information from the Jepson Horticultural Database for Rosa pisocarpa:

Given excellent drainage (modification of compacted or other water-holding soils may be necessary) and moderate summer watering, grows especially well in zones 4, 5, and 6.

Given DRN,IRR,part SHD, grows especially well in zone 7 and also in zones 1, 14, 15, 16, and 17.

Difficult; needs special care in all zones; has complex requirements

Rosa roxburghii var. hirtula — Rosaceae !

INFO
Common Name: Chestnut Rose
Perennial Shrub
Native Range: China, Japan
Description: For the species:
Shrubs diffuse, 1–2.5 m tall. Bark gray-brown; branchlets ascending-spreading, purple-brown, terete; prickles paired at nodes, mostly straight, to 5 mm, somewhat flat, abruptly narrowing to broad base. Leaves including petiole 5–11 cm; stipules mostly adnate to petiole, free parts subulate, margin glandular-pubescent; rachis and petioles with scattered small prickles; leaflets 9–15, elliptic or oblong, rarely obovate, 1–2 × 0.6–1.2 cm, glabrous, abaxially with prominent veins, conspicuously reticulate, base broadly cuneate, margin acutely simply serrulate, apex acute or rounded-obtuse. Flowers solitary, or 2 or 3 and fasciculate apically on branches, 4–6 cm in diam.; pedicel short; bracts 2 or 3, small, margin glandular-pubescent. Hypanthium depressed-globose, densely bristly. Sepals 5, usually broadly ovate, abaxially densely prickly, adaxially tomentose, pinnately lobed, apex acuminate. Petals 5, slightly fragrant, pink to rose-purple or reddish, obovate. Carpels on projected torus at base of hypanthium; styles free, not exserted, shorter than stamens, pubescent. Hip green-red, depressed-globose, 1.5–2 cm in diam., densely prickly, with persistent, erect sepals. Fl. Mar–Jul, fr. Aug–Oct.

Mountain forests, thickets, slopes, stream sides, also cultivated; 500–1400 m. Anhui, Fujian, S Gansu, Guangxi, Guizhou, Hubei, Hunan, Jiangxi, S Shaanxi, Sichuan, Xizang, Yunnan, Zhejiang [Japan].

Two forms may be recognized: f. roxburghii, which has double or semi-double, reddish or pink flowers 5–6 cm in diam., and f. normalis Rehder & E. H. Wilson (in Sargent, Pl. Wilson. 2: 318. 1915), which has simple, pink flowers 4–6 cm in diam. The specific epithet was spelled "roxbourgii" in the protologue.

The edible fruit are very rich in vitamins and have a sweet, sour taste; they are used medicinally and to ferment wine. The roots are also used medicinally. The species

Rosa rubiginosa — Rosaceae !

INFO
Common Name: sweet briar, eglantine rose
Perennial Shrub
Flowers Pink
Native Range: Europe
Description: From MO Bot Gard:
Rosa rubiginosa, commonly called sweet briar or eglantine rose, is a European species rose that has escaped gardens and naturalized along roadsides, in pastures and in open areas in many parts of North America including Missouri. It is perhaps most noted for its aromatic dark green foliage that releases a sweetly fragrant perfume (suggestive of apples) after a rainstorm or when brushed with the hand. It is a vase-shaped, dense, suckering shrub that typically grows to 6-10' tall. Long arching canes are heavily thorned. Spicily-fragrant, five-petaled, clear pink flowers (to 2" diameter) with white centers appear in late spring to early summer (late May-June in St. Louis). Flowers are followed by abundant orange-red hips that ripen in fall and usually persist well into winter. Aromatic young spring foliage produces the best fragrance. This species synonymous with Rosa eglanteria.

Rosa rugosa Rosaceae !

INFO
Common Name: rugosa rose
Perennial Shrub
Description: Shrubs erect, to 2 m tall. Stems fasciculate, robust; branchlets tomentose; prickles dense, yellowish, terete, straight, greatly variable in size and intermixed, to 5 mm, fine, evenly tapering to base, lower parts tomentose, intermixed with glandular bristles. Leaves including petiole 5–13 cm, thick; stipules mostly adnate to petiole, free parts ovate, abaxially tomentose, margin glandular-pubescent, apex acute; rachis and petiole tomentose, sometimes with a few, short prickles; leaflets 5–7(–9), elliptic or elliptic-obovate, 1.5–4.5 × 1–2.5 cm, abaxially tomentose, reticulate, adaxially glabrous, shiny, rugose due to concave veins, base rounded or broadly cuneate, margin acutely serrate, apex acute or rounded-obtuse. Flower solitary, or several and fasciculate, axillary, 4–5.5 cm in diam.; pedicel 5–25 mm, tomentose and glandular-pubescent; bracts ovate, abaxially tomentose, margin glandular-pubescent, apex acuminate. Hypanthium subglobose, glabrous. Sepals 5, ovate-lanceolate, often leaflike, abaxially pubescent and stipitate glandular, adaxially sparsely pubescent, pinnately lobed, apex caudate-acuminate. Petals 5, double or semi-double, purple-red, dark pink, or white, obovate, base cuneate, apex emarginate. Styles free, slightly exserted, much shorter than stamens. Hip dark red, depressed-globose, 2–2.5 cm in diam., smooth, with persistent, erect sepals. Fl. May–Jun, fr. Aug–Sep. 2n = 14*.

Coastal hillsides, sandy soils on sea shores, offshore islands; below 100 m. Native in E Jilin (Hunchun Xian), Liaoning, NE Shandong (Yantai Shi); widely cultivated elsewhere in China [Japan, Korea, Russia (Far East)].

This species has many horticultural forms widely cultivated in China. According to Fu (China Plant Red Data Book 1: 558–559. 1992), it is endangered as a wild plant by picking and uprooting.

Taxon | Family Spelling Checked

Rosa sericea f. pteracantha — Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-6ft.
Native Range: China: Yunnan
Synonomy: Rosa omeiensis fo. pteracantha (Franch.) Rehder & E.H. Wilson
Description: Erect Shrubs, 3-6 feet tall. Branchlets purple-red or purple brown, glabrous, robust when old, and with broad, flat, winglike prickles. Flowers solitary, axillary, 1-2 inches in diameter. This delightful rose has translucent blood-red thorns on this year's stems. The flowers are single white and also very beautiful so to get both, leave a few old stems for next year (they will carry the flowers but have brown thorns) and cut the rest to the ground for the above effect in summer.

Image of © 2009 Mona Bourell, SFBG1986-0632

For the species:
Shrubs erect, 1–2 m tall. Branchlets robust; prickles absent or in pairs below leaves and scattered, terete, to 1.2 cm, fine to robust, abruptly flaring to a broad base, or prickles winglike, to 1.2 cm and 3.5 cm in diam.; bristles sometimes dense. Leaves including petiole 3.5–8 cm; stipules mostly adnate to petiole, free parts auriculate, pubescent or glabrous, margin glandular; rachis and petiole pubescent, sometimes sparsely prickly and glandular-pubescent; leaflets (5–)7–11(–13), ovate or obovate, rarely obovate-oblong, 8–20 × 5–8 mm, abaxially sericeous-villous or subglabrous to glabrous, glandular or not, adaxially glabrous, rugose, base broadly cuneate, margin serrate in upper part, entire below, apex rounded-obtuse or acute. Flower solitary, axillary, 2.5–5 cm in diam.; pedicels 1–2 cm, glabrous; bracts absent. Hypanthium obovoid or globose, subglabrous. Sepals 4, ovate-lanceolate, abaxially sparsely pubescent or subglabrous, adaxially villous, margin entire, apex acuminate or acute. Petals 4, white, broadly obovate, base broadly cuneate, apex emarginate. Styles free, shorter than stamens, slightly exserted, villous. Hip red or purple-brown, obovoid or globose, 8–15 mm in diam., glabrous, with persistent, erect sepals; pedicel 1–2 cm, glabrous, usually not fleshy. Fl. May–Jun, fr. Jul–Aug. 2n = 14.

Sparse woods, forest margins, scrub, valley slopes, dry valleys, cliffs, mountain summits, gravels, dry sunny places; 2000–4400 m. Guizhou, Sichuan, Xizang

Rosa spinosissima 'Stanwell Perpetual' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 6-8ft.
Flowers White, Pink
Description: White, near white or white blend Hybrid Spinosissima.
Bred by C. Brown (United Kingdom). Bred by Lee (UK) (United Kingdom, before 1834).
Damask Perpetual, Hybrid Spinosissima.
White, light pink shading. Moderate fragrance. up to 45 petals. Average diameter 3.25". Medium to large, very full (41+ petals), cluster-flowered, flat bloom form. Occasional repeat later in the season.
Height of 6' to 8' (185 to 245 cm).
USDA zone 3b through 9b. Heat tolerant. prefers full sun. shade tolerant. Disease susceptibility: very disease resistant.
Tetraploid
Unknown
Mrs. Gore states it as a chance seedling from the garden of a Mrs. Lee in Stanwell. The firm of Lee in Hammersmith, had also nursery grounds in Stanwell, Middlesex. Finally, John Peacock and his sons operated a nursery in Stanwell Lodge, Bonington Road, Leith, Edinburgh.

It is unique in its class because it is repeat-flowering. Buist classes it under Perpetuals (Portlands)
Record Notes: Name checked with The Plant List on 7/8/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Rosa willmottiae Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 9ft.
Flowers Pink May, Jun
Native Range: China
Description: Shrubs 1–3 m tall. Branchlets slender, glabrous; prickles in pairs below leaves, numerous, terete, straight, to 1.2 cm, slender, abruptly flaring at base, old branches rarely bristly. Leaves including petiole 2–4 cm; stipules mostly adnate to petiole, free parts ovate-lanceolate, margin glandular serrate or entire; apex acute; rachis and petiole glabrous or sparsely pubescent, glandular-pubescent and shortly prickly; leaflets 7–9, rarely 11, elliptic, obovate, or suborbicular, 6–17 × 4–12 mm, abaxially glabrous or puberulous along midvein, glandular or not, adaxially glabrous, base subrounded, rarely broadly cuneate, margin simply serrate, doubly serrate above middle, apex rounded-obtuse. Flower solitary, ca. 3 cm in diam.; pedicel 1–1.5 cm, often glandular-pubescent; bracts ovate-lanceolate, abaxially with distinct midvein, margin glandular serrate, apex caudate. Hypanthium oblong to subglobose, glabrous. Sepals 5, triangular-lanceolate, abaxially glabrous, adaxially densely pubescent, margin entire, apex elongate. Petals 5, pink, obovate, base cuneate, apex emarginate. Styles free, much shorter than stamens, densely pubescent. Hip orange-red, oblong or subglobose, ca. 1 cm in diam., glabrous, shiny, when ripening apical part of hypanthium and sepals deciduous together. Fl. May–Jun, fr. Jul–Sep.

Thickets, scrub, open slopes, stream sides, roadsides; 1300–3800 m. Gansu, Qinghai, Shaanxi, Sichuan.

Rosa woodsii var. ultramontana Rosaceae !

INFO
Common Name: interior rose
Perennial Shrub
Flowers Red Apr, May, Jun, Jul, Aug, Sept
Native Range: California
Description: Loose shrub to thicket, generally 5–40 dm tall. Stem ± gray- or reddish-brown; prickles few to many, generally ± slender (sometimes ± thickened in Mojave desert), ± straight or slightly curved. Leaf 3–11 cm long; stipule margins with 0 or few glands; leaflets 2--3 per side, sparsely hairy to glabrous; terminal leaflet ± 10–40 mm long, ± elliptic, the base obtuse to acute, the tip ± obtuse; leaf-margins generally single-toothed and glandless. Inflorescence generally 1–5-flowered; pedicels generally ± 10–20 mm long, generally ± glabrous, glandless. Flowers: body of hip in flower generally 3–5 mm wide, glabrous, neck of hip 2–4 mm wide; sepals glandless, generally entire (or with a few simple, linear lobes), sepal-tip generally ± equalling sepal-body, entire; petals generally 15–20 mm long; pistils generally > 10 in number. Hip most often ± ovoid, 5–12 mm wide, glabrous, neck 3–5 mm wide, sepals persistent. n = 7. Blooming (April) May to September (October); earlier extreme in southern deserts, later in Sierra Nevada. Generally ± moist areas; 800–3400 m elev.
The interior rose is the common native rose east of the Sierra Nevada, in the San Bernardino and San Gabriel mountains, and in the higher mountains of the Mojave Desert (e.g., Providence Mts). It also occurs in some higher elevation sites in the Sierra Nevada (e.g., around Lake Tahoe) and extends west to an uncertain extent in northern California. The variety occurs north to British Columbia and Montana, while the typical variety (var. woodsii) grows in the central United States.
Cultivation: The Interior Rose is the obvious native species for horticultural purposes in transmontane California and the Intermountain West in general.
Record Notes: Name checked with Jepson Manual, 12/18/2007.

Taxon Family Spelling Checked

Rosa x rugosa 'Alba' Rosaceae !

INFO
Common Name:
Description: Rosa rugosa var alba or white rugosa rose is among the highest rated roses by the American Rose Society, & is a recipient of the Royal Horticultural Society's Award of Garden Merit. White Rugosa roses bloom primarily in the spring, especially in April & May, but also have sporadic moderate blooms until autumn. The first photo shows it in July; the third photo shows it in October. The blooms are singles about four inches wide.

This heirloom shrub has been gardened for centuries in Korea, China, & Japan, & in Europe since at least 1870. It is extremely cold-hardy & can suceed even in USDA zone 2, having a natural range in Asia as far north as eastern Siberia. In spite of being very sun-hardy for the xeriscape garden, it is not as heat-hardy as one might suppose, & is apt to fail above zone 8. Its ideal is temperate coastal maritime conditions, ultra-ideal for the coastal Northwest, or right here around Puget Sound.

Its large, edible, decorative hips are turning pink by July & are ripe & deep bright orange by August. Because the shrub reflowers over a long period, the hips are ripening serially early summer until mid-autumn. The ones which are harvested immediately after a good frost are sweetest, as the frost lowers the pectin & heightens the sugar content, but even the hips that ripen in summer are surprisingly sweet fresh from the bush. Though very seedy, the flavor is extremely appealing even raw, but they are usually cooked & strained for jellies due to the density of black seeds. If the cherry-tomato-sized hips are not harvested for jellies or other uses, they will remain on the branches after leaf-fall & continue to provide bright spots of color until autumn's end, occasionally into the start of winter.

White RugosaBecause the hips are one of the most striking features ornamentally as well as a prized fruit for harvest, rugosas are not deadheaded, but maximum hip production is preferred. It will reflower even without deadheading, with hips & blossoms occuring side-by-side during summer, as can be seen on this page's uppermost photo in July.

Taxon Family Spelling Checked

Rosa x rugosa 'Blanc Double de Coubert' Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-5ft. Spread: 4ft.
Flowers White Apr, May, Jun, Jul, Aug
Description: Deciduous. Fragrant.
Flowers Early Summer through Early Fall.
'Blanc Double de Coubert' is a hybrid rugosa shrub rose which typically grows to 5' tall and as wide. Features profuse, strongly fragrant, pure white, 2-3" diameter, semi-double flowers which bloom throughout the summer and into fall. Leathery, wrinkled, dark green foliage. Large, orange-red hips follow blooms. Cochet-Cochet, France (1892). Rugosa means wrinkled in reference to the appearance of the foliage.

Cultivation: Tolerates most soils, light shade, and coastal conditions.
Best grown in medium moisture, slightly acidic, well-drained garden loams in full sun to part shade. Best flowering and disease resistance generally occur in full sun, however. Water deeply and regularly (mornings are best). Avoid overhead watering. Good air circulation promotes vigorous and healthy growth and helps control foliar diseases. Summer mulch helps retain moisture, keeps roots cool and discourages weeds. Remove spent flowers to encourage rebloom. Crowns need winter protection in cold winter areas such as St. Louis. Remove and destroy diseased leaves from plants, as practicable, and clean up and destroy dead leaves from the ground around the plants both during the growing season and as part of a thorough cleanup during winter (dormant season). Prune as needed in late winter to early spring.

Record Notes: Name checked with The Plant List on 2/26/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon Family Spelling Checked

Roscoea cautleoides Zingiberaceae !

INFO
Common Name: Roscoea
Perennial Herbaceous
Height: 2ft.
Flowers Yellow, Purple, White Summer
Native Range: China, Himalayas
Description: Tuberous perennial from China. Has upto 4 lance shaped, mid green leaves. Bears hooded, 2-3 lobed lipped flowers usually creamy yellow but can be white or purple. Flowers June-September. Likes a moist, well drained, humus rich soil in sheltered, cool, partial shade. Will not do well in warm gardens. Hardy down to 7F and may be a little hardier if planted deeply. "Of moonlight radiance" is one author's opinion of this lovely plant from China bearing in summer bunches of beautiful, very large yet delicate flowers of a rare shade of the palest, cool luminous yellow, and with broad petals with the appearance of having been fashioned in soft, crimpled silk. Quite unlike any other hardy plant. 6 -10 ins.

Roscoea tibetica — Zingiberaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 0.5ft.
Flowers Purple or violet
Native Range: Tibet, China, Bhutan, India
Description: Plants 5–15 cm tall. Leaves 1–3, forming a rosette; ligule obscure, ca. 0.5 mm; leaf blade elliptic, widest near base, 2–6 × 1–2.5 cm, obscurely to densely hairy especially when young, apex obtuse to acute. Inflorescence enclosed by leaf sheaths; bracts elliptic, 2.2–4 cm. Flowers purple or violet, held just above leaf rosette. Calyx brown spotted, 3–4 cm, apex 3-toothed. Corolla tube 4–5 cm; central lobe oblong, cucullate, 1.5–1.7 cm × ca. 8 mm, apex apiculate; lateral lobes lanceolate, 1.5–1.8 cm × 4–5 mm. Lateral staminodes oblong, 1–1.3 cm. Labellum slightly reflexed, obovate 1.4–2.5 × 0.8–1.8 cm including claw, usually deeply lobed for more than 1/2 its length. Anther cream; connective spur 3–7 mm. Ovary cylindric, ca. 1.5 cm. Fl. Jun–Jul.

Pinus forests, scrub, alpine meadows; 2400–3800 m. Sichuan, Xizang, Yunnan [Bhutan, India].

Cultivation: Does well in a raised bed of clayey loam, where it has plenty of moisture, but good drainage, all summer.

Record Notes: Name checked with IPNI, and Flora of China, 7/29/2008.

Taxon Family Spelling Checked

Rosmarinus officinalis 'Gorizia' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 4-5ft.
Flowers Pinkish-blue, medium blue,
Description: Rosmarinus officinalis 'Gorizia' was introduced in the fall of 1986 by Tom DeBaggio. The aroma of the leaves is not overpowering, but is gentle and "green" to the nose.
Cultivation: Does best in full sun but it will tolerate partial shade. The plant prefers a well-drained soil and has some drought tolerance. Do not overwater.
The plant, unique in its coarse vigor, is a tender perennial, hardy to about 10 degrees Fahrenheit; it also grows as a very large rosemary in the South.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones. Layering

Record Notes: Cultivar name found used in the trade with internet search, 3/22/2010.

Rosmarinus officinalis 'Ken Taylor' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 1-2ft. Spread: 4-5ft.
Flowers Blue
Description: From San Marcos Growers:
Rosmarinus officinalis 'Ken Taylor' (Rosemary) - A sprawling shrub with arching branches that reach 3 feet long. The plant grows 1-2 feet tall and 4-5 feet wide. Very showy full bloom of dark blue flowers occurs in the spring.This is a very attractive rosemary for its flower display and interesting form A plant of this in bloom in our garden has always drawn comments from visitors. It is a selection made from a sport of Rosmarinus 'Collingwood Ingram' by the late Ken Taylor.
Cultivation: Plant in full sun. As with other Rosemary it is resistant to deer and rabbit predation, tolerant to salt spray, alkaline soils and drought. Hardy to 15°F.
Record Notes: Name checked with The Plant List on 9/10/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Rubus buergeri Rosaceae !

INFO
Common Name:
Perennial Shrub
Flowers White
Native Range: Tibet, China, Japan, Korea
Synonomy: Rubus bodinieri H. Léveillé & Vaniot; R. buergeri var. pseudobuergeri (Sasaki) Y. C. Liu & Yang; R. pseudobuergeri Sasaki; R. shimadae Hayata.
Description: Shrubs erect to creeping. Stems often rooting at nodes; stolons to 2 m, brownish to reddish brown, stolons and flowering branchlets densely tomentose-villous, unarmed or with sparse, minute prickles. Leaves simple; petiole 4–9 cm, densely tomentose-villous, sometimes with sparse prickles; stipules caducous, free, 7–10 mm, palmatipartite or pinnatipartite, lobes linear or linear-lanceolate, soft hairy; blade ovate to suborbicular, 5–11 cm in diam., palmately 5-veined, lateral veins 2 or 3 pairs, prominently raised abaxially, abaxially densely tomentose, with soft hairs along veins when young, hairs deciduous in age, adaxially slightly soft hairy or only hairy along veins, base cordate, margin 5–7-lobed, lobes unevenly sharply serrate, apex obtuse, rarely acute. Inflorescences terminal or axillary, short subracemes, 4–6 cm, few flowered, or flowers several in clusters in leaf axils; rachis and pedicels densely tomentose-villous, with sparse prickles or not; bracts 7–9 mm, palmatipartite or pinnatipartite; lobes linear, villous. Pedicel 5–9 mm. Flowers 6–10 mm in diam. Calyx abaxially yellowish villous and tomentose; sepals erect in fruit, rarely reflexed, lanceolate or ovate-lanceolate, 5–9 × 3–5 mm, apex acuminate; outer sepals often lobed apically, inner sepals entire. Petals white, obovate, nearly as long as or slightly longer than sepals, glabrous, apex erose. Stamens many, shorter than petals; filaments linear, glabrous. Pistils glabrous, longer than stamens. Aggregate fruit purplish black, subglobose, 6–10 mm in diam., glabrous; pyrenes coarsely rugose. Fl. Jul–Aug, fr. Sep–Oct. 2n = 42*, 56*.
Broad-leaved forests, mixed forests in mountainous regions; Low to medium elevations. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Japan, Korea].

Taxon Family Spelling Checked

Rubus ichangensis

Rosaceae !

INFO
Common Name:
Perennial Shrub
Height: 9ft.
Flowers White
Native Range: China
Synonomy: Rubus eugenius Focke; R. ichangensis var. latifolius Cardot; R. papyrus H. Léveillé.
Description: Shrubs scandent, deciduous or semievergreen, to 3 m tall. Branchlets greenish to greenish brown, terete, glabrous or subglabrous, with glandular hairs when young, glabrescent, with sparse, curved short prickles. Leaves simple; petiole 2–4 cm, glabrous, usually with sparse, glandular hairs and short prickles; stipules caducous, subulate or linear-lanceolate, 4–8 mm, glabrous, with sparse, short glandular hairs marginally, margin entire or only apically shallowly laciniate; blade ovate-lanceolate, 8–15 × 3–6 cm, subleathery, both surfaces glabrous, abaxially with sparse, small prickles along midvein, base deeply cordate, with broad basal incision, margin shallowly undulate or lobulate near base, sparsely serrulate, apex acuminate. Inflorescences terminal and axillary, terminal ones narrow cymose panicles, 15–25 cm, axillary ones subracemes, shorter; rachis and pedicels sparsely pubescent, with glandular hairs, sometimes intermixed with small prickles; bracts subulate to linear-lanceolate, 4–6 mm, margin entire or apically laciniate, with sparse, glandular hairs. Pedicel 3–6 mm. Flowers 6–8 mm in diam. Calyx abaxially sparsely pubescent, with glandular hairs; sepals ovate, 3–5 × 2–3 mm, margin sometimes gray pubescent, apex acute to shortly acuminate. Petals white, elliptic, shorter than or nearly as long as sepals. Stamens many, shorter than petals; filaments somewhat broadened and flattened. Pistils 12–30, slightly shorter than or ca. as long as stamens, glabrous. Aggregate fruit red, subglobose, 6–8 mm in diam., glabrous; pyrenes rugulose. In China: Fl. Jul–Aug, fr. Sep–Oct. 2n = 28*.
Native habitat: Slopes, fallow fields, dense forests in valleys, thickets; 800--2500 m. Anhui, Gansu, Guangdong, Guangxi, Guizhou, Hubei, Hunan, Shaanxi, Sichuan, Yunnan.

The fruit are sweet and edible, the roots are used in medicine, and tannin is extracted from the roots and stems

8/15/2006 Mona Bourell: Shannon planted out into granite pots in front of offices on Martin Luther King Blvd. 8/2/2006.

7/14/2006 Tony Morosco: 18 additional 4 inch plants added to accession from same source for use in 6 round stone planters around County Fair Building by designer Dan Carlsen.

6/20/2006 Tony Morosco: Plants found planted in bed 6G during inventory, no accession forms. ID by Dan Carlson, Wigglestem Gardens.

Taxon Family Spelling Checked

Rubus parviflorus Rosaceae !

INFO
Common Name: western thimbleberry
Perennial Shrub
Flowers White Mar
Native Range: California (except Great Central Valley, Desert); ± to s Alaska, Ontario, New Mexico, n Mexico.
Synonomy: Rubus cuneifolius Pursh
Description: Plant 0.5–2(2.5) m, erect; prickles 0.
Stem: to 6 mm diam, not angled, glabrous to finely hairy with stalked glands, not glaucous, not rooting at tips.
Leaf: simple, palmately (3)5-lobed, coarse-toothed, tip acute, abaxially finely to densely gray-hairy; stipules 1.5–3 mm wide, triangular- lanceolate to narrow- ovate.
Inflorescence: panicle-like cyme, flowers 3–7(15).
Flower: sepals hairy, stalked- glandular; petals (10)14–22 (30) mm, widely elliptic to obovate to round, white; filaments thread-like; pistils > 30, styles short, thick, ovaries densely hairy.
Fruit: raspberry-type, red.
2n=14. Common; moist semi-shaded areas, especially edges of woodland; 20–2500 m. California (except Great Central Valley, Desert); ± to s Alaska, Ontario, New Mexico, n Mexico. [Rubus parviflorus var. velutinus Greene] Mar–Aug
Record Notes: Name checked with The Plant List on 2/24/2014 by Mona Bourell.

Rubus rolfei — Rosaceae !

INFO

Common Name: Creeping Raspberry, Ornamental Raspberry
Perennial Groundcover
Flowers White Jun, Jul
Native Range: Taiwan, Philippines: Quezon
Synonomy: Rubus calycinoides Hayata ex Koidzumi (1913), not Kuntze (1879); R. calycinoides Hayata var. macrophyllus H. L. Li; R. elmeri Focke; R. hayatae-koidzumii Naruhashi; R. pentalobus Hayata; R. rolfei var. lanatus Hayata.
Description: Subshrubs low, with creeping stems and ascending leafy shoots. Stems prostrate, rooting at nodes, densely tomentose-villous, with sparse, small prickles, sometimes nearly unarmed, glabrate in age. Leaves simple; petiole nearly as long as leaf blade, tomentose-villous, with sparse, needle-like prickles; stipules free, obovate to ± oblong, 7–12 mm, membranous, margin pectinately or palmately laciniate ca. 1/2 to middle at apex, abaxially hairy, adaxially glabrous; blade broadly ovate to suborbicular, 2–6(–9) × 2–5.5(–9) cm, venation pedate, lateral veins 4 or 5 pairs, raised abaxially, impressed adaxially, leathery, abaxially brownish gray tomentose, with long hairs and sparse, needle-shaped prickles along veins, adaxially dark greenish brown, usually sparsely hairy when young, later glabrous, bullate between veins, base cordate, basal incision to 1 cm deep, margin 3–5-lobed; lobes obtuse, unevenly crenate. Inflorescences terminal and axillary, 1- or few flowered; rachis and pedicels densely tomentose-villous, with sparse, needle-like prickles; bracts obovate to ±oblong, 8–10 mm, apex palmately or pectinately laciniate, hairy. Pedicel 5–9 mm. Flowers to 2 cm in diam. Calyx 1–1.5 cm, abaxially tomentose-villous; sepals ovate or triangular-lanceolate, 8–10 × 4–7 mm, apex laciniate; lobes linear-lanceolate. Petals white, suborbicular or obovate, 7–10 × 6–8 mm, adaxially puberulous, base clawed. Stamens many; filaments to 5 mm; anthers to 1 mm, with few long hairs, rarely glabrous. Pistils fewer than stamens, glabrous. Aggregate fruit yellow to orange or reddish, globose, 1–1.4 × ca. 1 cm, fleshy, with reddish persistent calyx; drupelets obliquely ellipsoid; pyrenes rugose; seeds reniform. Fl. Jun–Jul, fr. Aug–Sep. 2n = 28*, 42*.
Native habitat: Open places, mixed forests; 1300–3800 m. Taiwan [Philippines].

Taxon Family Spelling Checked

Rubus rosifolius var. coronarius — Rosaceae !

INFO

Common Name:
Perennial Shrub
Flowers White
Native Range: India, Indonesia, Malaysia, Nepal, Sikkim
Synonymy: Rubus coronarius Sims, Bot. Mag. (Curtis) 43: t. 1783. 1815; R. rosifolius f. coronarius (Sims) Kuntze; R. rosifolius var. wuyishanensis Z. X. Yu.

Description: Shrubs erect or climbing, 2–3 m tall. Branchlets grayish brown or dark reddish brown, terete, soft hairy or subglabrous, with straight to curved prickles and yellowish glands. Leaves imparipinnate, usually 5–7-foliolate; petiole 2–3 cm, petiolule of terminal leaflet 0.8–1.5 cm, lateral leaflets subsessile, petiolule and rachis with soft hairs and sparse, minute prickles, sometimes subglabrous, with yellowish glands; stipules linear or lanceolate to ovate-lanceolate, 0.8–1.2 cm × 1.5–3.5 mm, sparsely soft hairy; blade of leaflets ovate or ovate-elliptic to lanceolate, 4–7(–10) × 1.5–5 cm, both surfaces pilose, subglabrescent, with yellow glands, abaxially with sparse, minute prickles along midvein, base rounded, margin sharply incised doubly serrate or coarsely doubly serrate, apex acuminate. Inflorescences terminal or in leaf axils, 1- or 2-flowered; bracts linear or lanceolate, 5–9 mm, puberulous. Pedicel (1–)2–3.5 cm, with ± soft hairs and sparse, minute prickles, sometimes glandular. Flowers 2–3(–5) cm in diam. Calyx abaxially soft hairy and glandular; sepals erect before anthesis, reflexed after anthesis, triangular-lanceolate or ovate-lanceolate, 0.8–1.2(–1.4) cm × 4–6 mm, apex long caudate. Petals white, oblong, narrowly obovate, or suborbicular, 0.8–1.5 × 0.8–1.2 cm, abaxially shortly hairy, base clawed, apex obtuse. Stamens many, shorter than petals; filaments broad. Pistils to 2 mm, shorter than stamens; ovary glabrous, sometimes glandular; styles glabrous; torus shortly stalked. Aggregate fruit red, ovoid-globose or narrowly obovoid to oblong, 1–1.5 × 0.8–1.2 cm, glabrous, with few glands; pyrenes deeply foveolate. Fl. Mar–May, fr. Jun–Jul. 2n = 14*.

Var. coronarius:
Branchlets, petioles, and pedicel ± prickly. Flowers double, fragrant, 3–5 cm in diam.

Taxon Family Spelling Checked

Rubus setchuenensis Rosaceae !

INFO
Common Name: Szechuan Bramble
Perennial Shrub
Height: 7-14ft.
Flowers Pink, Purple
Native Range: East Asia
Potentially Invasive
Description: A decidious shrub growing to 3.5m. It is hardy to zone 5. Large round, elegantly-scalloped leaves don't look "bramblish", & small pink to purple flowers in pretty clusters don't sound "bramblish",but this 7-14'luxuriant shrub is a "bramble", with good tasting black fruit to prove it, too!

Noted as potentially invasive with irrigation from observations of rampant growth in SFBG nursery in summer/fall 2005.
Cultivation: Seed - requires stratification and is best sown in early autumn in a cold frame. Stored seed requires one month stratification at about 3°c and is best sown as early as possible in the year. Prick out the seedlings when they are large enough to handle and grow on in a cold frame. Plant them out into their permanent positions in late spring of the following year.
Propagation: Cuttings of half-ripe wood, July/August in a frame[200].
Tip layering in July. Plant out in autumn.
Division in early spring or just before leaf-fall in the autumn[200].
Record Notes: Name checked with The Plant List on 2/25/2013 by Mona Bourell.

ACCESSION

Rubus spectabilis Rosaceae !

INFO
Common Name: salmon berry, salmonberry
Perennial Shrub
Height: 3-5ft. Spread: 3-5ft.
Flowers Pink Spring
Native Range: Santa Cruz Co. - Alaska
Synonomy: Parmena spectabilis (Pursh) Greene

Description: Plant 2–4 m, erect; prickles few, ± stout, slender, straight.
Stem: 3–15 mm diam, not angled, glabrous, not glaucous, persisting 2 yrs, not rooting at tips.
Leaf: simple to generally compound, leaflets 3, terminal widely ovate, ± lobed, coarse-double-toothed, tip acute to acuminate, abaxially glabrous to densely hairy; stipules <= 1 mm wide, thread-like to linear.
Inflorescence: axillary, flowers 1–2.
Flower: sepals hairy, ± stalked- glandular; petals (10)15–22(30) mm, elliptic to narrow-obovate, magenta; filaments strap-like; pistils generally > 30, styles long, slender, ovaries glabrous.
Fruit: raspberry-type, ± yellow to orange to red.
2n=14. Moist areas, especially edges of woodland, streambanks; generally < 500 m. North Coast, nw Klamath Ranges, n Outer North Coast Ranges, n Central Coast, w San Francisco Bay Area; to Alaska. [Rubus spectabilis var. franciscanus (Rydb.) J.T. Howell] Mar–Jun

Taxon Family Spelling Checked

Rubus ursinus — Rosaceae !

INFO
Common Name: California blackberry
Perennial Shrub
Flowers White
Native Range: Western North America
Invasive
Description: Pl prostrate to decumbent; gen dioecious; bristles or prickles gen many, weak, slender, straight. ST: 2–10 mm diam, not angled, ± glabrous to hairy, ± with stalked glands, glaucous, persisting 2 yrs, rooting at tips. LF: simple or compound, lflets 3(5), terminal triangular-ovate, irregularly coarse-toothed, tip acute, abaxially sparsely to densely gray-hairy, stipules thread-like to linear, <= 1 mm wide. INFL: cyme, fls 1–5. FL: gen unisexual; sepals hairy, prickly, ± with stalked glands; petals 6–8(11) mm in pistillate, 10–15(18) mm in staminate, elliptic to round, white; filaments thread-like; pistils > 30, styles long, slender, ovaries glabrous or hairy. FR: blackberry-type, black. 2n=42,49,56,63,77,84,91. Common. Open, disturbed areas; < 1500 m. CA-FP; to BC, ID, Baja CA.

Cultivation: Information from the Jepson Horticultural Database for Rubus ursinus
Given SUN or SHD, grows especially well in zones 4, 5, 6, and 17.

Given IRR,SUN or SHD, grows especially well in zones 7, 14, 15, 16, 19, 20, 21, 22, 23, and 24 and also in zones 1, 2, 8, 9, and 18.

Especially good for stabilizing or restoring disturbed or degraded areas. May be less suitable for general garden use.

Invasive; once established, tending to outcompete, displace, or overrun others

Record Notes: Name checked with TROPICOS, 5/18/2011.

Rumfordia penninervis Asteraceae !

INFO
Common Name: Mexican daisy bush
Perennial Herbaceous
Flowers Yellow Feb, Mar, Jan
Native Range: Mexico, Guatemala
Description: www.strangewonderfulthings.com/315.htm
From Strange Wonderul Things:
This terrific bush is new to cultivation and probably isn't available anywhere else. It was found in the mountains of southern Mexico, where it is rare. It doesn't have a common name, so i am calling it the "Mexican Daisy Bush". Each winter, this Daisy & Sunflower relative lights up with big clusters of bright yellow blooms. The plant comes from a cool climate and is untested in warm climates.
Rumfordia grows 10 to 15 feet tall, with attractive, jointed stems that resemble bamboo. You may prune the plant to any height that is convenient. The blooms appear from November through February, when most other plants are lacking color. Each flower cluster typically has from 1 to 5 dozen blooms, each about an inch across and with 8 to 12 petals. The orange centers add a nice highlight, and are a favorite of honey bees.
Rumfordia comes from mountain cloud forests of Chiapas in Mexico, where daytime temperatures are usually in the 60s and 70s, and nights are cool but frost-free. It's possible that the plant might not thrive if temperatures consistently get above the low-80s, especially if nights are warm. It probably can survive a few degrees of frost, but since it flowers in winter, i recommend protecting it from freezing temperatures. It is easy to grow indoors in a pot. It likes well-draining soil that is kept evenly moist. Like many cloud forest plants, it prefers filtered sun, or morning sun + bright shade. Protect it from strong afternoon sun. Over about 50% humidity is recommended.

Taxon Family Spelling Checked

Rumohra adiantiformis Dryopteridaceae !

INFO
Common Name: leatherleaf fern
Perennial Fern/Pteridophyte
Height: 3ft.
Native Range: Southern Hemisphere
Description: This evergreen fern has triangular-shaped, dark glossy green, medium-textured leaflets arising from a central clump. The bold, heavy, leathery fronds, sometimes three feet high, are of unsurpassed keeping quality when cut and are much prized for use in floral arrangements. Plants spread by meansof a rusty-red, aboveground stolon and eventually form dense mats of lacy foliage, making Leatherleaf Fern ideal for groundcover use in shaded locations.

Ruscus aculeatus — Asparagaceae !

INFO

Common Name: butcher's broom
Perennial Shrub
Flowers Greenish white, Purple Feb, Mar
Native Range: Europe
Description: Tough, green, erect, striated stems, which are destitute of bark, send out from the upper part many short branches, plentifully furnished with very rigid leaves, which are really a mere expansion of the stem, and terminate each in a single sharp spine. The small greenish-white flowers are solitary growing from the centre of the leaves and blossom in the early spring. They are dioecious, i.e. stamens and pistils are on different plants, as is also mostly the case with the Holly and Mistletoe. The corolla is deeply six-cleft, the stamens, in the one kind of flower, connected at the base, the style, in the fertile flowers, surrounded by a nectary. The fertile flowers are succeeded by scarlet berries as large as cherries, which are ripe in September, and remain attached to the plant all the winter and cause it often to be picked for room decoration.

image of © 2014 Marc AK Johnson1980-0372

In fruit in May at SFBG.
Cultivation: Butcher's Broom is very hardy, thriving in almost any soil or situation, and is often planted in shrubberies or edges of woods, on account of its remaining green after the deciduous trees have shed their leaves.
Propagation: Propagation is generally effected by division of the roots in autumn. The shrub may also be propagated by seed, but quicker results are obtained by the other method. When planted under trees it soon spreads into large clumps.
Record Notes: Name checked with The Plant List on 9/18/2012 by Mona Bourell.

Ruscus hypoglossum Asparagaceae !

INFO
Common Name: horse-tongue lily, butcher's broom
Perennial Shrub
Height: 1.5ft.
Flowers Yellow
Native Range: W. Europe - Iran
Description: Compact, evergreen sub-shrub with creeping rootstock to 18 inches high, more or less arching scarcely woody. cladodes 3-4.5 inches long, 1 to 1.5 inches wide, tapering at both ends, lower narrow-oval, upper oblanceolate. Flowers 3-5, small, yellow in axil of a leaf-like bract 1 to 1.5 inches long on upper side of cladode. Berry (rarely produced) red, globose, 0.25 to 0.5 inches wide.

Cultivation: f. It is a great groundcover for under trees, because it is shade-loving and not invasive. Plant in bright to deep shade and water only occasionally to regularly. Hardy to USDA zone 7b (5-10 degrees F)
Record Notes: Name checked with The Plant List on 2/20/2013 by Mona Bourell.

Russelia equisetiformis Scrophulariaceae !

INFO
Common Name: fountainbush
Perennial Shrub
Flowers Red Mar, Apr, May, Jun, Jul, Aug, Sept, Oct, Nov
Native Range: Mexico
Synonymy: Russelia juncea
Description: Coral plant is a multi-branched subshrub with slender, rushlike stems that are angled with ridges and leaves that are reduced to little more than small scales. The wiry branches start out erect then fall over to cascade down in lengths as long as 4 ft (1.2 m). From spring until fall outdoors and all year long indoors, coral plant produces hanging clusters of scarlet tubular flowers about 1 in (2.5 cm) long that look like little firecrackers inspiring the plant's other common name, firecracker plant.
Cultivation: Grow in a humus rich, well drained soil and fertilize regularly.
Light: Full sun or partial shade.
Moisture: Water regularly and don't let the soil dry out.
Hardiness: USDA Zones 9 - 12.

May be sensitive to cold areas.

Propagation: Easy to propagate from tip cuttings.

Record Notes: Name checked with IPNI, 12/28/2007.

Ruta chalepensis — Rutaceae !

INFO
Common Name: Fringed Rue
Perennial
Native Range: Mediterranean
Description: This Mediterranean "Rue" is extremely EASY to grow, tolerant of many conditions and is evergreen in our milder areas. The lovely, feathery, teardrop-shaped leaves are topped by greeny-yellow, cup-shaped flowers on much branched stems. Long history of medicinal uses. Some folks think the foliage is malodorous and it's reported that some folks' skin is irritated by the foliage. TOLERATES DRY OR WET & SANDY, CLAY, ROCKY SOIL.

Sabal minor — Arecaceae !

INFO
Common Name: dwarf palmetto
Perennial Palm
Height: 6ft.
Native Range: SE United States - Mex: Nuevo Leon
Synonomy: Sabal adansonii, Sabal deeringiana, Sabal glabra, Sabal louisiana, Corypha minor
Description: Stems usually subterranean. Leaves 4–10, dark green, weakly costapalmate, little if at all curved, not bearing fibers between segments; hastula obtuse, 0.8–4.7 cm; segments not filiferous, 34——84 ´ 1.4–3.7 cm; apices weakly if at all bifid2-cleft. Inflorescences sparsely branched with 2 orders of branching (not counting main inflorescence axis), erect, much longer than leaves. Flowers 3.5--5.2 mm. Fruits brownish black, spheroid, length 6.2--8.5 mm, diam. 6.4--9.7 mm; pericarp thin. Seeds 3.5--5.1 mm, diam. 4.4--6.9 mm diam. 2n = 36.

Flowering spring–summer. Mesic hammocks, floodplains, levees, river banks, swamps, but occurring on much drier sites in west-central Tex.; ca. 10–600 m; Ala., Ark., Fla., Ga., La., Miss., N.C., Okla., S.C., Tex.; Mexico.

Previously thought to be endemic to the United States, this species was only recently found in Nuevo León, Mexico (D. H. Goldman 1999).

Sabal minor is usually a small palm with a subterranean trunk; however, one can find individuals with larger features and well-developed aerial stems. In Louisiana, these individuals were recognized as separate species (J. K. Small 1929; M. L. Bomhard 1935), but more recently they have been treated as merely ecological variants of a single widespread species (A. Henderson et al. 1995; P. F. Ramp and L. B. Thien 1995; S. Zona 1990). Large emergent forms of S. minor were even thought by B. J. Simpson (1988) to be hybrids of that species with S. palmetto, but his claim is undocumented and unsubstantiated.
Shorter description:
Stems solitary, short and subterranean, but sometimes erect and then to 2m tall and 10-20 cm diameter. Leaves 4-10, dark green, with a weakly developed costa; leaflets 15-65, rigid, joined for a short distance at base, the leaf appearing rather circular. Inflorescences

Sabal pumos — Arecaceae !

INFO
Common Name: royal palmetto
Perennial Palm
Height: 66ft.
Description: One of the few palmettos that seems to prefer somewhat higher altitudes and does not occur on the plains at sea level. In its native range in central Mexico, it is found at elevations between 600 and 1300 m (2000 and 4300 ft.), growing in a zone between dry deciduous forest and oak forest. Like many Sabal, it also thrives on cultivated land, where it is tolerated because its large leaves are useful for thatching. It is a large, imposing species with a big crown of strongly costapalmate leaves, supported by a comparatively slim trunk to 20 m (66 ft.) tall, which is covered with the old, split bases of fallen leaves in younger trees. One of the most obvious distinguishing characteristics of this palmetto is the size of its fruits and seeds, which are considerably larger than those of any other species in the genus. The fruits are edible with a date-like flavor.
Cultivation: The Royal Palmetto adapts easily to cultivation and does well in most temperate climates. It is resistant to drought and, despite its home in the mountains, can take some coastal exposure.
Record Notes: Spelling checked with IPNI and The Plant List. 11/22/2011

Sagittaria latifolia — Alismataceae !

image of 1975 John Kipping

INFO
Common Name: wapato
Perennial Aquatic
Native Range: N - S America
Synonomy: Sagittaria latifolia var. latifolia, Sagittaria chinensis, Sagittaria esculenta, Sagittaria longirostra, Sagittaria obtusa, Sagittaria ornithorhyncha, Sagittaria planipes, Sagittaria pubescens, Sagittaria viscosa, Sagittaria engelmanniana ssp. longirostra, Sagittaria latifolia var. obtusa, Sagittaria latifolia var. pubescens, Sagittaria variabilis var. obtusa
Description: Herbs, perennial, to 45 cm; rhizomes absent; stolons present; corms present. Leaves emersed; petiole triangular, erect to ascending, 6.5–51 cm; blade sagittate, rarely hastate, 1.5–30.5 ´ 2–17 cm, basal lobes equal to or less than remainder of blade. Inflorescences racemes, rarely panicles, of 3–9 whorls, emersed, 4.5–28.5 ´ 4–23 cm; peduncles 10–59 cm; bracts connate more than or equal to ¼ total length, elliptic to lanceolate, 3–8 mm, delicate, not papillose; fruiting pedicels spreading, cylindric, 0.5–3.5 cm. Flowers to 4 cm diam.; sepals recurved to spreading, not enclosing flower or fruiting head; filaments cylindric, longer than anthers, glabrous; pistillate pedicellate, without ring of sterile stamens. Fruiting heads 1–1.7 cm diam; achenes oblanceoloid, without abaxial keel, 2.5--3.5 ´ to 2 mm, beaked; faces not tuberculate, wings absent, glands (0–)1(–2); beak lateral, horizontal, 1–2 mm. 2n = 22.
Flowering summer–fall. Wet ditches, pools, and margins of streams and lakes; 0–1500 m; Alta., B.C., Man., N. B., N.S., Ont., P.E.I., Que., Sask.; Ala., Ark., Calif., Colo., Conn., Del., D.C., Fla., Ga., Ill., Ind., Iowa, Kans., Ky., La., Maine, Md., Mass., Mich., Minn., Miss., Mo., Nebr., N.H., N.J., N.Y., N.C., N.Dak., Ohio, Okla., Pa., R.I., S.C., S.Dak., Tenn., Tex., Vt., Va., W.Va., Wis.; c, s Mexico; Central America (Guatemala); South America (Colombia, Ecuador, Venezuela).

Sagittaria latifolia has been divided into numerous species and varieties. It was divided into two varieties, based upon the presence of pubescence over the entire vegetative plant (C. Bogin 1955; K. Rataj 1972). We have examined numerous specimens and found that many from the southeastern United States are pubescent; we believe that this character alone is insufficient for recognition of the varieties

Taxon Family Spelling Checked

Salix breweri Salicaceae !

INFO
Common Name: Brewer's willow, serpentine willow
Perennial Shrub
Flowers Yellow
Native Range: California: Glenn - Monterey Co.
Not Invasive
Description: Native shrub found in serpentine seeps, springs, and streams from Glenn County to Monterey County.
Shrub < 4 m
Stem: twigs yellow-brown, velvety or silky-tomentose
Leaves: stipules vestigial or leaf-like; young leaves silky; mature blade 58–144 mm, lanceolate to widely elliptic or oblanceolate, acute (base rounded to acute), entire to shallowly wavy-toothed, slightly rolled under, lower surface glaucous, generally densely tomentose, midrib glabrous, upper surface sparsely tomentose
Inflorescence appearing before leaves, 20–85 mm, sessile or on leafy shoots < 5 mm; flower bract tawny to light rose
Staminate flower: stamens 2
Pistillate flower: ovary very densely tomentose, style 0.4–0.8 mm, stalk 0–0.4 mm, nectary generally thread-like
Ecology: Serpentine streamsides
Elevation: 300–1300 m.
Bioregional distribution: North Coast Ranges, San Francisco Bay Area, n&c South Coast Ranges. Hybrids with S. lasiolepis Benth. in Yolo Co. have leaves less hairy, fruit long, slender, stalked, becoming glabrous. Like S. delnortensis C. K. Schneid. but has shorter petioles, flexible twig bases
Cultivation: Information from the Jepson Horticultural Database for Salix breweri:
Given moderate summer watering or continuously moist or wet soil and full or nearly full sun (tolerates summer afternoon sun), grows especially well in zones 5 and 17 and also in zones 4, 6, 7, 8, 9, 14, 15, 16, 22, 23, and 24.

Record Notes: Name checked in Calflora 5/31/2005.

Salix delnortensis Salicaceae !

INFO
Common Name:
Perennial Shrub
Flowers not significant
Native Range: N Calif - S Ore
Synonomy: Salix breweri var. delnortensis (C.K. Schneid.) Jeps.
Description: Shrub < 2 m
Stem: twigs yellowish brown, brittle at base, tomentose or velvety, becoming glabrous
Leaves: young leaves velvety or silky; mature blade 53–102 mm, elliptic to widely obovate, obtuse or abruptly pointed (base obtuse to acute), entire, slightly rolled under, lower surface glaucous, densely tomentose, upper surface sparsely tomentose
Inflorescence appearing before leaves, 15–40 mm, sessile or on leafy shoots < 5 mm; flower bract tawny to pinkish
Staminate flower: stamens 2
Pistillate flower: ovary silky, style 0.6–1.2 mm, stalk 0–0.3 mm
Ecology: Serpentine streamsides
Elevation: 90–500 m.
Bioregional distribution: nw Klamath Ranges (near Gasquet, Del Norte Co.)
Distribution outside California: sw Oregon
Like S. breweri Bebb; may hybridize with S. lasiolepis Benth

Taxon Family Spelling Checked

Salix exigua Salicaceae !

INFO
Common Name: sandbar willow, Narrow-leaved Willow, narrowleaf willow
Perennial Shrub
Height: 10 - 25ft. Spread: 20ft.
Native Range: Western North America
Description: Shrub < 7 m, clonal by root-sprouting
Stem: twigs brownish, silky or long-soft-wavy-hairy, becoming glabrous
Leaves: stipules 0 or vestigial; petiole short; young leaves silky; mature blade 50–124 mm, linear, acuminate (base wedge-shaped), entire to sharply serrate (teeth well separated), silky, glaucous below or not
Inflorescence appearing with or after leaves, sometimes branched, 22–70 mm, on leafy shoots 5–110 mm; flower bract tawny; pistillate bract deciduous after flower
Staminate flower: stamens 2
Pistillate flower: ovary glabrous, silky, or sparsely soft-shaggy-hairy, stigma deciduous after flower, style 0–0.2 mm, stalk 0.2–1 mm
Chromosomes: 2n=38
Ecology: Common. Streamsides, marshes, wet ditches
Elevation: < 2700 m.
Bioregional distribution: California
Distribution outside California: to Alaska, e N.America, Arizona, Mexico
Flowering time: Mar–May

Beautiful silver leaves. Rhizomatous, can sprout 10 feet away from parent plant.
A thicket forming shrub with numerous small diameter stems, spreads by underground root suckering, may reach up to 25 feet tall.
Leaf: Alternate, simple, lanceolate to linear, 2 to 5 inches long and very narrow, entire or with a few scattered teeth, green to gray-green above, paler and maybe hairy below.
Flower: Dioecious, 1 to 2 1/2 inches long, fuzzy catkins on a slender 1 inch stem, yellowish white, appearing in spring with the leaves.

Fruit: Small (1/4 inch) long pointed capsules in long, narrow clusters; each capsule contains numerous small fuzzy seeds.

Twig: Slender, pale green to tan, may be reddish in winter, fuzzy or not; buds covered by a single cap-like scale

Taxon Family Spelling Checked

Salix exigua var. hindsiana Salicaceae !

INFO
Common Name: sandbar willow
Perennial shrub/tree
Native Range: California - Oregon
Synonomy: Salix hindsiana Bentham, Pl. Hartw., 335. 1857; S. exigua var. parishiana (Rowlee) Jepson; S. hindsiana var. leucodendroides (Rowlee) C. R. Ball; S. hindsiana var. parishiana (Rowlee) C. R. Ball; S. macrostachya Nuttall var. leucodendroides Rowlee; S. parishiana Rowlee; S. sessilifolia Nuttall var. hindsiana (Bentham) Andersson ex Bebb; S. sessilifolia var. leucodendroides (Rowlee) C. K. Schneider

Description: Shrubs or trees, 1-5(-17) m. Stems: branches gray-brown or red-brown, glabrous or hairy; branchlets yellow-brown or red-brown, pubescent or densely long-silky-villous, hairs spreading, appressed. Leaves: stipules rudimentary on early ones, foliaceous or rudimentary on late ones; petiole puberulent, villous, or short-silky adaxially; largest medial blade (sometimes hypostomatous) linear, 39-96 × 5.3-14 mm, 6.5-31 times as long as wide, abaxial surface glabrous or densely silky-villous to glabrescent, hairs appressed or spreading, straight, adaxial sparsely to very densely long-silky-villous; juvenile blade densely silky-villous abaxially (hairs relatively long, spreading, appressed). Catkins: staminate 7-42 × 4-9 mm, flowering branchlet 2-56 mm; pistillate densely or moderately densely flowered, slender to stout, 22-43 × 3-11 mm, flowering branchlet 2-55 mm; floral bract 1.4-2.6 mm, apex acute or convex, entire or erose, abaxially hairy throughout or proximally, hairs wavy, straight, or crinkled. Staminate flowers: abaxial nectary 0.5-0.9 mm, adaxial nectary narrowly oblong, square, or ovate, 0.4-1.1 mm; anthers 0.6-1.1 mm. Pistillate flowers: adaxial nectary oblong, ovate, or flask-shaped, 0.4-1.3 mm, longer than stipe; stipe 0-0.2 mm; ovary pyriform, pilose or villous to glabrescent, beak abruptly tapering to styles; ovules 12-24 per ovary; styles (± distinct) 0.2-0.5 mm; stigmas flat, abaxially non-papillate with pointed tip, or slenderly cylindrical, 0.3-1 mm.
Flowering mid Apr-mid May. Riparian, sandy-gravel floodplains; 0-600 m; Calif., Oreg.

Variety hindsiana often is not distinguished from var. exigua. The two are difficult to separate morphologically

Salix integra 'Hakura Nishiki' Salicaceae !

INFO
Common Name: Dappled Japanese Willow, Variegated Willow, Red Twig Willow, Variegated Leaf Willow
Perennial Shrub
Height: 4-10ft. Spread: 6-8ft.
Flowers Yellow early spring
Synonomy: "Salix integra 'Hakuro Nishiki' also sold as 'Fuiji Koriangi,' 'Fuiji Nishiki' or 'Albomarginata,' & occasionally with the name 'Hakuro Hishiki' which appears to be a common mispelling as on the commercially printed label on the specimen we obtained some years ago." [http://www.paghat.com/hishiki.html]
Description: This shrub has variegated leaves with pink tones of great beauty spring through autumn, but come winter, it takes on new color even without leaves. Younger twigs turn coral red during the chilly season. The bark is not red in other seasons. Quite amenable to pruning, & regular pruning can even be recommended to increase the coloration of the winter limbs, since newer growth will be the reddest. First introduced to the west in 1979, it has become a very widespread nursery offering both as a fountaining shrub & as a slender-trunked sapling of a tree.
Cultivation: It likes sun but is best in part shade. It also likes lots of water in the springtime when it's putting on its main growth; the rest of the year it's best if it never entirely dries out, yet it is more tolerant of occasional drought than it is of being deluged with waterings.

Salix magnifica Salicaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs or small trees. Branchlets stout, pruinose when young, glabrous. Buds large, glabrous. Petiole red when young, to 4 cm, stout; leaf blade elliptic, ovate, or obovate-oblong, to 20 × 11 cm, leathery, abaxially glaucous, adaxially dark green, base rounded or subcordate, rarely broadly cuneate or attenuate, margin entire when young, irregularly glandular serrulate, apex rounded, obtuse, mucronate, or acute; lateral veins ca. 15 each side of often purplish red midvein, diverging from midvein at nearly 90°, raised on both surfaces, at first villous, soon glabrescent. Catkins to 10 × 1.5 cm, glabrous throughout; peduncle ca. 7 cm, with 2-5 normal leaflets; rachis stout; bracts broadly obovate to oblong, 1.5-3 mm, apex obtuse-rounded, or truncate and irregularly dentate. Male flower: adaxial gland large, usually 2-parted, abaxial gland smaller; stamens 2, distinct or partly connate, ca. 5 mm. Fruiting catkin to 23 cm. Female flower: adaxial gland broadly ovate, truncate, depressed or 2-cleft; ovary ovoid-cylindric, ca. 5 mm; stipe to 2 mm; style ca. 1 mm, apex 2-lobed or abruptly contracted; stigma 2-cleft. Capsule ovoid-ellipsoid or ovate, 5-7 mm, subsessile or stipe to 4 mm. Fl. May-Jun, fr. Jun-Jul.
Ovary 2-lobed at apex; capsule ovoid-ellipsoid, ca. 5 mm

* Near water, woodlands on mountain slopes; 2100-3000 m. N and W Sichuan.

Record Notes: Spelling checked in GRIN database 12-17-2005; further research needed on authors, native regions, common names, etc.

Salix purpurea 'Nana' — Salicaceae !

INFO Common Name: purple willow
Perennial Shrub
Height: 3-5ft. Spread: 3-5ft.
Description: This purpleosier willow cultivar is a compact, rounded, deciduous shrub which typically grows to 5' tall and features attractive purple stems. Often best grown as a 2-3' tall, clipped shrub. Very narrow, blue-green leaves (to 4" long). Dioecious. Grayish-white male and female flowering catkins (1 inch) bloom in early spring before the foliage. Slender and supple twigs can be used to make baskets.
Cultivation: Bloom Time: April to May
Bloom Description: Grayish-white
Sun: Full sun
Water: Medium to wet
Maintenance: Medium
Suggested Use: Hedge, Rain Garden
Flower: Showy
Attracts: Butterflies
Tolerate: Deer, Clay Soil, Wet Soil, Black Walnut
Record Notes: Name checked with The Plant List on 6/30/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia 'Allen Chickering' — Lamiaceae ?

INFO
Common Name:
Perennial Shrub
Height: 5ft. Spread: 5ft.
Flowers Deep lavender
Parentage: Salvia clevelandii x S. leucophylla
Description: From San Marcos Growers:
Salvia 'Allen Chickering' (Sage) - A dense shrub that grows to 5 feet tall with an equal or greater spread. Leaves are gray-green and approximately 1 inch long. The 2 foot long flower spikes of deep lavender flowers form on a tier of whorls in late spring and summer.
Cultivation: For its best appearance it requires full sun, well draining soil and little summer watering. Once established it requires even less watering. This Salvia is frost hardy to about 15 degreess F. As with other native sages to keep a dense and more attractive plant cut back in the winter by about a third or more when young - once mature with woody stems, only tip prune
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Reported to be a hybrid of S. clevelandii and S. leucophylla.

Salvia 'Bee's Bliss' Lamiaceae !

INFO
Common Name: sage
Perennial Shrub
Parentage: Salvia sonomensis or Salvia clevelandii with Salvia leucophylla
Description: A shrub grows low to the ground, never exceeding 2 feet, and can reach 6 to 8 feet wide. Whorls of lavender-blue flowers bloom on spikes in spring into summer, rising above the tomentose gray-green leaves. Makes a great groundcover on slopes. Plant in full sun and water sparingly. This plant is drought tolerant and dislikes ovehead irrigation which can promote powdery mildew. A hybrid that is thought to be a cross of Salvia sonomensis or Salvia clevelandii with Salvia leucophylla that was selected by Roger Raiche at the University of California Botanic Garden and named by Marcia Donehue. Considered hardy to to 20-25° F but has reportedly survived to 18° F without damage.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 5/22/2008.

Taxon Family Spelling Checked

Salvia 'Dancing Lights' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 1.5-2ft.
Flowers Bright pink
Parentage: S. microphylla x S. greggii
Description: Some really interesting (and unexpected) bicolor patterns emerged in our second generation of Salvia hybrids. Salvia 'Dancing Lights' was one of the most intriguing. It has the spreading plant habit and large, bright leaves one would expect from its S. microphylla parentage. However, apart from their large size, the flowers are completely unique. Each is shaded purplish pink on the tube and the basal half of the lower lip. The upper lip and outer half of the lower lip are vivid, glowing red. Best in sun to part shade, with moderate to occasional watering.

Flowering Season:

Spring to fall

Cultivation: Exposure:
Full sun
Soils:
Well-drained soil
Suggested Irrigation:
Moderate to occasional watering
Estimated Hardiness:
Hardy to 15-20 degrees F.

Record Notes: Name checked on 5/6/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Salvia 'Jean's Purple Passion' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: >5ft.
Flowers Purple year-round?
Parentage: possibly Salvia gesneriflora and Salvia mexicana, but in doubt.
Description: A deep purple salvia named from spontaneous seedling found in Cabrillo College and named after Jean Coria (volunteer at SFBG). Parents of this hyrbid are possibly Salvia gesneriflora and Salvia mexicana, but are not known for certain.
Cultivation: Possibly somewhat difficult to grow, requiring Cloudforest-like conditions. Possibly puts too much energy into flowering, and less into vegetative growth.
Record Notes: Name confirmbed by Jean Coria, whom plant is named after 12/6/2005.

ACCESSION **SFBG# 2005-0702 DEACCESSIONED** Rec'd: 12/6/2005

Salvia 'Purple Majesty' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 4-5ft. Spread: 4-5ft.
Flowers Purple
Parentage: S. guaranitica x S. gesneriiflora
Description: Salvia 'Purple Majesty' (Sage) - A large semishrubby perennial that grows to 5 feet tall this Salvia has an upright and somewhat open habit. The shiny dark green leaves are broad, pointed and heavily textured. The deep purple tubular flowers that appear in late summer- fall have a velvet-texture and are formed on whorls.
Cultivation: It grows best in full sun along the coast or light shade inland in a fast draining soil with moderate to regular watering in a garden location that does not become too cold in winter.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade wth internet search, 2/23/2009.

Salvia 'Scarlet Spires' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 3.5ft. Spread: 1.5ft.
Flowers Red
Parentage: Salvia x 'Raspberry Delight' and Salvia darcyi
Description: 3-3 1/2' x 18" wide, (cutting propagated). An HCG introduction, this hybrid Sage is a cross between two outstanding garden performers: Salvia x 'Raspberry Delight' and Salvia darcyi. A must for hummingbirds, 'Scarlet Spires' blooms all summer with tall spikes of screaming scarlet flowers.
This hybrid salvia's 12-inch-long coral-red flower spikes are almost indistinguishable from those of Salvia darcyi, but the plant has a more compact, full-mounded form. Also, its attractive spoon-shaped gray-green foliage is not "clingy" and thus is easier to work around. 'Scarlet Spires' grows three to four feet tall and blooms continuously from July through frost.

Cultivation: In colder climates where it might not over-winter, this non-stop bloomer is a 5-star container plant for hot, sunny areas.

Zones (6?)7-10

Taxon | Family Spelling Checked

Salvia 'Waverly' — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 3-5ft.
Flowers Pinkish white
Description: From San Marcos Growers: A half hardy shrub to 5 feet tall with pale pink flowers through most of the year.Seems to be somewhat related to Salvia leucantha but we are still searching for the origins of this plant. We received it from Mark Bartholomew of Hi-Mark Nursery and for some time the plant was known only as Salvia 'Mark's Mystery White'. Later we were told that it had the cultivar name 'Waverly' but this has never been verified. In the Fall 2001 issue of Pacific Horticulture Magazine an article by Betsy Clebsch also asks about the origins of this sage. Rich Dufresne had also applied the name Salvia leucantha cv. 'Santa Barbara' to this plant but retracted it so not to be confused with another compact Mexican sage called 'Santa Barbara'. Dufresne also noted that for a while on the East coast it was known as 'San Marcos Lavender'
Cultivation: Will get knocked to the ground in a frost but sprouts back and grows to full height within a couple months. Plant in full sun and irrigated regularly for best results - sulks if kept dry.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 11/12/2008.

Salvia 'Wendy's Wish' — Lamiaceae !

INFO
Common Name:
Perennial Shrub
Flowers Deep purplish red
Description: An evergreen shrub with compact growth to about 3 to 4 feet tall by 3 feet wide with mid-dark green colored leaves have serrated margins along dark maroon stems. Rising above the foliage from spring through fall are the unique tubular flowers with fluted tips. The flower corolla characteristics seem to more resemble Salvia buchananii in color, which is a deep purplish red and flower size with a flower calyx that is pinkish brown, more like Salvia splendens.

Taxon Family Spelling Checked

Salvia apiana

Lamiaceae !

INFO

Common Name: Grandfather Sage, White Sage, Greasewood
Perennial Shrub
Height: 3ft. Spread: 2ft.
Flowers Blue, White Spring
Native Range: S. Calif., Baja Calif.
Not Invasive
Description: White sage is a two to five foot evergreen perennial. The flowers emerge in summer and are white with a little lavender. They pucker-back with the stamens hanging out to the sides. White sage gives the bees fits because they can't get in and out very well. Bumblebees seem to be able to fight their way in and hummingbirds figure it out. White sage leaves start out crinkly grey/green and become smooth white. A sage native to the southern coast ranges, into the Palmdale area along the desert south up to at least 5800 feet. Salvia apiana likes dry slopes, full sun, and no extra water. It is not specific to one soil, growing in sandy loam, granitic scree, and red loamy clay. In the garden if it is happy it makes a very large flower spike (5') with 100+ 1" flowers. White sage is hardy to about 12 F. here in the central coast ranges, but is more hardy in the desert areas. In its range it receives between 6-26" of rain/year. This sage will survive 0 in the higher desert areas, such as above Palmdae and not here in the centrall coast ranges because the temperatures dip down below freezing only for a few hours (the ground doesn't freeze) there.
Cultivation: Requires a very well-drained light sandy soil in a sunny position. Plants grow best in a dry climate and can be killed by excessive winter wet
Propagation: Seed - sow March/April in a greenhouse. Germination usually takes place within 2 weeks. Prick out the seedlings into individual pots when they are large enough to handle and plant them out in early summer. In areas where the plant is towards the limits of its hardiness, it is best to grow the plants on in a greenhouse for their first winter and plant them out in late spring of the following year.
Cuttings of half-ripe wood succeed at almost any time in the growing season.

Salvia arborescens Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 5 metersft.
Flowers White
Native Range: Carribean
Description: rocky half open places, hard limestone
Another very rare Salvia, found only in the mountains in the Dominican Republic. The name...arborescens... indicates that this species is tree-like, which is quite true, as it grows up to 5 metres tall. Apparently not at all spectacular, with a short flowering period.
image of 2011-0273
Cultivation: Notes from Scott Zona, PhD, Conservatory & Greenhouse Curator, Florida International University , Miami:
In our greenhouse here in Miami, the plants bloomed in January, with delicate white, nectar-rich flowers. My plants suck up water amazingly fast! They are in large pots, in a peat-based compost. The cuttings that I'm sending were a bit too long on the mist bench, so I had to cut a lot of roots to separate them. I have no doubt, however, that they'll recover quickly and put out new roots. The cuttings root very easily under mist.

The cuttings from which my plants were grown were collected from several plants growing in close proximity, but I have no way of knowing if they were rooted bits from the same mother. In other words, I don't know if the cuttings are genetically distinct.

I am currently doing a taxonomic revision of the section to which Salvia arborescens belongs. I'll send a reprint along when it gets published. I am very grateful that you can give these plants a home. There are no restrictions on the material, so you may share it with others.

Record Notes: Name checked with The Plant List, 4/15/2011.

Taxon | Family Spelling Checked

Salvia argentea — Ericaceae !

INFO
Common Name: silver sage
Perennial Herbaceous
Height: 1-2ft. Spread: 3ft.
Flowers White
Native Range: Southern Europe
Description: Native to Southern Europe, Eastern Mediterranean & North-West Africa.
Salvia argentea (Silver Sage, Silver Salvia, Silver Clary) is a biennial or short-lived perennial plant that is native to an area in southern Europe from Portugal to Bulgaria. Its specific epithet, argentea, refers to the silvery leaves.

S. argentea has a large spread of basal leaves that measure 1 m (3.3 ft) wide and 30 to 60 cm (0.98 to 2.0 ft) high. The individual leaves are 20 to 30 cm (7.9 to 12 in) long and 15 cm (5.9 in) wide. Both leaf surfaces are heavily covered with silky hairs that give it a wooly appearance. The leaves are soft to the touch, first emerging as a distinctive silvery white and then turning to grey-green after flowering. Cool weather in the fall turns the leaves silvery again.
Flowers appear in spring or summer on 60 to 90 cm (24 to 35 in) candelabra-like stalks that rise well above the foliage. The inconspicuous white flowers are tinged with yellow or pink. Cutting the flowers before they set seed results in a long-lived plant.
Cultivation: his is a species that is often classefied as a biennial, but in some cases it usually lasts several years and it is therefore best treated as a short lived perennial, which dies down below ground in winter. It is frost hardy to -10 C

Notes

Salvia brandegeei Lamiaceae !

INFO
Common Name: Santa Rosa Island sage, Brandegee's sage
Perennial Shrub
Flowers pale blue to lavender
Native Range: Channel Is - Baja Calif
Synonomy: Audibertia stachyoides var. revoluta Brandegee
Description: Shrub > 1 m or prostrate; hairs branched; heterostylous.
Leaf: 2–6 cm; blade linear to linear-elliptic, puckered, adaxially glabrous, abaxially densely white-hairy; margins rolled under; teeth small, rounded.
Inflorescence: clusters 1.5–2 cm wide; bracts ovate, colored, tips sharp.
Flower: calyx 7–8 mm, hairs long, wavy, upper lip minutely 3-lobed; corolla tube 7–8 mm, pale blue to lavender, upper lip 3–3.5 mm, lower lip 3–4 mm; stamens ± included.
Fruit: 1.5–2.5 mm, oblong, rough, brown.
2n=30. Coastal scrub; < 200 m. n Channel Islands (Santa Rosa Island); n Baja California. [Salvia brandegei, orth. var.] Feb–Aug
Record Notes: Name checked with The Plant List on 11/8/2011 by Mona Bourell.
Originally in record misspelled as S. brandegei.

Salvia buchananii Lamiaceae !

INFO
Common Name: Buchanan sage
Perennial Herbaceous
Height: 1.5-2ft.
Flowers Pink
Native Range: Mexico
Synonomy: Salvia bacheriana
Description: This sage is a neat compact plant. The leaves are glossy green. The flowers are a brilliant magenta and fuzzy. It blooms spring through fall. I have had no damage due to frost. The coldest conditions that my plants have experienced is in the low 20's. It is brittle and should not be placed in high traffic areas. The plant came into the western gardening world rather recently. It was collected from a garden in Mexico City.

Salvia cacaliifolia Lamiaceae !

INFO
Common Name: Ivy Leaf Sage, Blue Vine Sage
Perennial Shrub
Height: 2-3ft. Spread: 3-4ft.
Flowers Blue Jul, Aug, Sept, Oct
Native Range: Mexico: Chiapas
Description: Touted some 70 years ago by British garden writer William Robinson, this exceptional, long blooming Salvia offers fuzzy gentian-blue flowers. Its small but abundant, vividly colored blooms garnish terminal racemes above a many stemmed emerald-green foundation of thick triangular leaves.

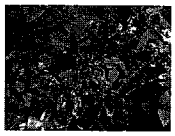

image of © 2011 Mona Bourell, SFBG

Indigenous to the mountainous regions of southern Mexico, Honduras and Guatemala, Salvia cacaliaefolia can be found growing as high as 8000 ft., its slow-to-spread, creeping roots thriving with well drained soil, regular water and high shade. A harbinger of cool, late season color.

image of © 2011 Mona Bourell, SFBG

Taxon Family Spelling Checked

Salvia canariensis Lamiaceae !

INFO
Common Name: Canary Island Sage
Perennial Herbaceous
Spread: 8ft.
Native Range: Canary Islands
Potentially Invasive
Description: This is a big shrub. It gets to an easy 8' in diameter. When it is in bloom there is nothing but color visible. Both the bloom and calyx is colored giving a lot to look at. The foliage is interesting as well. It has arrowhead shaped leaves that are pale green and a white wooly rachis and stems. For such tropical origins it seems to be remarkably hardy. I have taken into the high teens and had no problems. The biggest difficulty I have had is keeping track of the seedlings. I would not plant this near a wild land as it might escape cultivation. It seems to be rather short-lived 3 seasons at most. But there are always all of those seedlings to replace it with. Salvia candelabrum Lamiaceae !

INFO
Common Name: sage
Perennial Shrub
Height: 3-4ft. Spread: 1-2ft.
Flowers Violet blue ,
Native Range: Spain
Synonomy: Salvia candelabriformis St.-Lag.
Description: Salvia candelabrum is a woody based sage that native to Spain. It produces whorls of two-lipped, tubular, violet-blue flowers (to 1 1/2" long) in branched inflorescences atop long thin stems rising well above a clump of aromatic, wrinkled, lanceolate leaves. It typically grows 3-4' tall. Blooms mid-summer to fall.

Cultivation: Winter hardy to USDA Zones 8-10 where it may be grown in average, evenly moist, well-drained soils in full sun to part shade. It prefers sandy loams with sharp drainage. Some tolerance for drought. Deadhead spent flowers to encourage additional bloom.
Propagation: Cuttings may be taken and overwintered indoors. Although it may be grown as an annual (start seed indoors 6-8 weeks before last spring frost date), seed is often hard to find in commerce because this salvia is infrequently grown in the U. S.

Record Notes: Name checked with The Plant List on 8/19/2013 by Mona Bourell.

Salvia cardinalis Lamiaceae !

INFO
Common Name: cardinal sage
Perennial Herbaceous
Height: 4-5ft. Spread: 3-4ft.
Flowers Red
Native Range: Mexico
Synonomy: S. fulgens Cav.
Description: perennial herb native to the Mexican mountains adjacent to the state of Puebla, growing at 8,700-11,000 ft elevation. It prefers the edge of oak and coniferous woodlands, especially in clearings of Abies religiosa. The mountains receive fog and rain nearly year-round.
Salvia fulgens grows 4–5 ft high and 3–4 ft wide, and requires a long warm autumn for full blooming. The 2 in flowers grow in loose whorls, and are fire engine red. The upper lip has red hairs which glisten in the morning dew. A reddish-brown calyx remains long after the flowers drop. Inflorescences are usually about 4 in long, though occasionally a 12 in inflorescence appears. The heart-shaped leaves are pale yellow-green, about 1.5 in long by 1 in wide, and cover the plant quite profusely.
It was introduced into Western horticulture [as S. fulgens] in the 19th century.
Record Notes: Name checked in IPNI , TROPICOS, 11/18/2009.

Salvia cedrosensis 'Baja Blanca' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 2ft.
Flowers White
Description: A low, rounded subshrub to 2 feet tall and slightly wider. The white stems bear gray-green, somewhat rounded leaves 1/2 inches long and 3/4 inches wide. The 1/2 inch white flowers (the species is typically light to medium blue) are held in 4-5 inch long inflorescences. This diminutive sage has a pleasing shape, copious flowers, and a long blooming season, especially in when grown as a container specimen.
A Santa Barbara Botanic Garden Introduction. A selection by Michael Benedict from Cedros Island off the coast of Baja California, Mexico.

Cultivation: Well-drained soil best, but accepts heavy soils with careful watering. Avoid excess summer watering to prevent root rot pathogens. As with the genus, 'Baja Blanca' is prone to aphid infestations on new growth, but is otherwise insect- and disease-free.

Record Notes: Name found used in the trade with internet search, 3/31/2009.

Salvia clevelandii 'Allen Chickering' Lamiaceae !

INFO Common Name: Cleveland Sage
Perennial Shrub
Height: 5ft. Spread: 5ft.
Flowers Blue
Not Invasive
Parentage: S. clevelandii x S. leucophylla
Description: Fantastic aroma, culinary, silver foliage, dark blue, whorled flowers, deep-rooted, drought-tolerant. Attracts hummingbirds. A dense shrub that grows to 5 feet tall with an equal or greater spread. Leaves are gray-green and approximately 1 inch long. The 2 foot long flower spikes of deep lavender flowers form on a tier of whorls in late spring and summer. For its best appearance it requires full sun, well draining soil and little summer watering. Once established it requires even less watering. This Salvia is frost hardy to about 15 degreess F.
Cultivation: Full Sun, Low Water Needs

INFO Common Name:
Perennial Shrub
Height: 4ft. Spread: 4ft.
Flowers Lavender blue
Parentage: Salvia clevelandii x Salvia leucophylla
Description: A hybrid between Salvia clevelandii & Salvia leucophylla, this aromatic shrubby sage grows 4 ft. tall and 4 ft. wide. Early summer brings flower stalks with whorls of lavender-blue blossoms.

Cultivation: Good for sunny areas with good drainage. Occasional to little summer water. Flowers are attractive to hummingbirds and butterflies. Deer and drought tolerant.
Like its parents it is very drought tolerant and grows well in hot and sunny areas.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Species name checked with The Plant List, 7/20/2011. Cultivar name found used in the trade with internet search, 7/20/2011.

Salvia clevelandii 'Winifred Gillman' Lamiaceae !

INFO
Common Name: California blue sage
Perennial Shrub
Flowers Blue purple
Description: This drought tolerant evergreen California native Salvia is a compact aromatic shrub with electric blue-purple flowers in summer.

Discovered in a Berkeley, California garden, this is a very five variety of the species. We have grown it without summer water, or in "normal" garden watering situations with success. The strongly scented flowers attract honeybees and hummingbirds in abundance.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cuiltivar name found used in the trade with internet search, 7/13/2010.

Salvia coahuilensis Ericaceae !

INFO
Common Name: Coahuila sage
Perennial Shrub
Height: 2.5ft. Spread: 2.5ft.
Flowers Violet purple
Native Range: Mexico
Description: From San Marcos Growers:
Salvia coahuilensis (Coahuila Sage) - A sprawling evergreen shrub that grows to about 2 tall and as wide or a little wider with narrow 1 inch long olive green leaves and violet purple flowers over a long period from late spring through fall. The foliage has a particular spicy aroma. This beautiful little sage comes from a restricted area in the mountainous Sierra Madre Occidental in the province of Coahuila, west of Saltillo.
Cultivation: Best planted in full sun in a well drained soil. It is fairly drought tolerant but looks better with occasional to regular irrigation. Hardy to 20 F. Cut back plants hard in winter to promote fresh new foliage in spring.
Record Notes: Name checked with The Plant List on 8/30/2011 by Mona Bourell.

Salvia confertiflora

Lamiaceae !

INFO

Common Name: Red Velvet Sage
Perennial Herbaceous
Height: 5ft. Spread: 3ft.
Flowers Red Sept - Nov?
Native Range: Brazil
Description: With velvety, reddish purple stems, smooth, bright green new foliage that matures to a textured dark green, and fuzzy, vermilion flowers, this Brazilian native is lush and tantalizing. Wonderful cut or dried, the 6 to 10 in. long flower spikes make a bold statement in the fall border with Asters and grasses, and combine beautifully with mounding perennials.
Record Notes: Name checked with The Plant List on 9/6/2011 by Mona Bourell.
