Tricyrtis lasiocarpa 'Amethystina' Liliaceae !

INFO
Common Name:
Perennial Geophyte
Flowers Purple
Synonomy: Tricyrtis formosana 'Amethystina'
Description: Clusters of 1-inch, amethyst-blue flowers, with white throats touched by yellow and speckled with dark red, appear in midsummer and continue steadily for 3 months. Shiny mid-green foliage is marked with red-brown in spring. Larger flowers than Tricyrtis formosana, in branched, terminal cymes. The tepals are pale lilac, with darker spots. Possibly introduced by Wayside Gardens.
Record Notes: Name checked,

Tricyrtis macranthopsis Liliaceae !

INFO
Common Name: yellow toad lily
Perennial Geophyte
Height: 2.5ft.
Flowers Yellow late summer-early fall
Native Range: Japan
Synonomy: T. macrantha Masamune [non Maxim.]
Description: Rhizomes short; stems 40-80 cm. long, reclined above; leaves distichous, narrowly oblong-ovate, 7-17 cm. long, 2.5-5 cm. wide, lustrous above, glabrous, gradually acuminate, cordate and clasping with 2 basal auricles or the lower edges placed on each side of the stems, pale green beneath and subglabrous to sparsely hirsute on the nerves; flowers axillary and terminal, solitary to few, pendulous, 3-4 cm. long, tubular-campanulate, glabrous; tepals oblanceolate, clear yellow, with brownish purple dots inside, the outer ones with a short spur at base, short-mucronate.
Cultivation: Preferring a sheltered semi-shaded site with adequate moisture they make ideal subjects for the woodland garden.

Propagation: By dividing rhizomes, tubers, corms or bulbs (including offsets); from seed.
Record Notes: Name found in IPNI, 10/6/2006.

Tricyrtis pilosa — Liliaceae !

INFO
Common Name:
Perennial Herbaceous
Flowers Purple, White Sept, Oct
Native Range: Himalayas
Synonymy: Compsoa maculata D. Don; Corchorus polygonatum H. Léveillé; Disporum esquirolii H. Léveillé; Tricyrtis maculata (D. Don) J. F. Macbride.
Description: Stem 50–90 cm, hispidulous distally. Leaves ovate-oblong to oblong-lanceolate, 8–14 × 6–9 cm, hispidulous on both surfaces, base cordate or rounded and amplexicaul, apex acuminate. Cymes terminal and sometimes also axillary in distal part of stem, laxly several to many flowered; rachis and pedicels hispidulous. Tepals spreading horizontally, at an angle of ca. 45°, or subascending, greenish white, with black-purple or purple-brown spots, ovate-oblong to lanceolate, 1.2–1.8 cm × 5–6 mm; outer ones slightly wider than inner ones, basally saccate. Stamens subequaling tepals. Ovary glabrous. Capsule 2–3 cm. Fl. and fr. Jul–Sep. 2 n = 26*.

Native habitat: Forests, hillsides; 300–2300 m. Gansu, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Shaanxi, Sichuan, Yunnan [Bhutan, India, Nepal].

Cultivation: shade to part shade, moist rich soil.

Trifolium wormskioldii Fabaceae !

INFO

Common Name: cow's clover
Perennial Shrub
Flowers Pink purple or magenta, white tip.
Native Range: Brit Col/California/Mexico
Synonomy: Trifolium willdenowii var. fimbriatum, Trifolium willdenowii var. kennedianum, Trifolium wormskioldii var. fimbriatum, Trifolium wormskioldii var. kennedianum, Trifolium spinulosum, Trifolium involucratum var. fendleri, Trifolium involucratum var. fimbriatum, Trifolium involucratum var. heterodon, Trifolium involucratum var. kennedianum, Trifolium kennedianum, Trifolium fendleri, Trifolium fimbriatum, Trifolium heterodon, Lupinaster wormskioldii, Trifolium willdenovii
Description: Perennial, cespitose or not, glabrous, rhizomed.
Stem: decumbent or ascending.
Leaf: generally basal; lower stipules bristle-tipped, upper wide, toothed or sharply lobed; leaflets 1–3 cm, narrowly elliptic to widely ovate.
Inflorescence: head-like, included or exserted from leaves, 2–3 cm wide; involucre wheel-shaped, segments or lobes many.
Flower: calyx 7–11 mm, lobes tapered, tips bristled; corolla 12–16 mm, pink-purple or magenta, tip white.
Fruit: stalk-like base 0–1 mm.
Seed: 2–4.
2n=16,32. Beaches to mtn meadows, ridges, generally open moist or marshy places; < 3200 m. Northwestern California, Cascade Range, Sierra Nevada, San Joaquin Valley, Central Western California, South Coast, Peninsular Ranges, East of Sierra Nevada; to British Columbia, Wyoming, New Mexico, Mexico. Incl matted, rhizomed form in dry coastal sands; lush, long-stemmed form at low to mid elevations; slender, generally much smaller form at mid to high elevations. May–Oct

Taxon Family Spelling Checked

Tristaniopsis laurina Myrtaceae !

INFO
Common Name: Water gum, Kanuka
Perennial Tree
Height: 45ft.
Flowers Yellow Jun, Jul, Aug, Oct
Native Range: Southeast Australia
Description: The species grows from 5 m to 15 m in height, is ideally suited to a large garden, and has also been planted as a street tree in Sydney. It grows slowly and rarely attains a large size in southern Australia. An attractive and compact shade tree in cultivation, T. laurina has a smooth bark when young, becoming scaly as the tree matures. The leaves are 5-12 cm long, 1-2 cm wide, glossy dark green above with a paler underside, and are alternately placed along the stems. The flowers are cream to orange-yellow in colour, being produced in short clusters in January and early February. The individual flowers are about 10 mm in diameter with five small, rounded petals and stamens united in five groups. The seed capsules are woody, globular in shape and 6-8 mm in diameter.
Cultivation: This tree grows well in cultivation and tolerates a variety of soil types from well-drained rocky soils to heavy clay loams, provided ample water is available. Being a small rainforest tree, it will tolerate light shade, though growth is more rapid in full sun.

Scale insects commonly attack this species and leaf-hoppers and leaf-eating beetles occasionally attack the leaves but damage is rarely severe enough to warrant spraying. Chemical control, if used, should focus on lower toxicity products that cause less environmental damage. Contact local experts for advice.
Propagation: Tristaniopsis laurina is grown from seed which normally germinates after three or four weeks. No special pre-sowing treatment is needed. The seed should be sown in a loose, well-drained propagation mix at a depth equal to the diameter of the seed. When the seedlings reach a height of 1-2 cm they should be pricked out into a large container until they have grown to a size suitable for planting out.
Record Notes: Name checked with The Plant List on 5/27/2014 by Mona Bourell.

Triteleia hyacinthina Themidaceae !

INFO
Common Name: White Brodiaea
Perennial Geophyte
Flowers White
Native Range: California to B.C., Idaho
Synonomy: Hesperoscordum hyacinthinum Lindley, Edwards's Bot. Reg. 15: under plate 1293. 1829; Allium lacteum (Lindley) Bentham; A. tilingii Regel; Brodiaea dissimulata M. Peck; B. hyacinthina (Lindley) Baker; B. hyacinthina var. lactea (Lindley) Baker; B. hyacinthina var. lilacina (S. Watson) Jepson; B. lactea (Lindley) S. Watson; B. lactea var. lilacina S. Watson; Hesperoscordum lacteum Lindley; H. lewisii Hooker; Hookera hyacinthina (Lindley) Kuntze; H. hyacinthina var. lactea (Lindley) Jepson; Milla hyacinthina (Lindley) Baker; M. hyacinthina var. lactea (Lindley) Baker; Triteleia lactea (Lindley) Davidson & Moxley; Veatchia crystallina Kellogg
Description: Leaves 10–40 cm × 4–22 mm. Scape 30–60 cm, smooth to scabrous. Flowers: perianth white, sometimes flushed purple abaxially, 9–16 mm, tube shallowly bowl-shaped, 2–4 mm, lobes ascending to spreading, with green midvein, 7–12 mm, 2–3 times longer than tube; stamens attached at 1 level, equal; filaments usually triangular-dilated, 2–4 mm, apical appendages absent; anthers whitish to yellow, rarely blue, 1–2 mm; ovary twice as long as stipe; pedicel 0.5–5 cm. 2n = 28, 84.

Flowering spring (Mar–Jun). Grasslands, vernally wet meadows, occasionally on drier slopes; 0–2000 m; B.C; Calif., Idaho, Nev., Oreg., Wash.

Triteleia hyacinthina is one of the most widely distributed members of the genus, common in low, moist places such as meadows, vernal pools, and along streams, and found occasionally in drier valley grasslands, foothill woodlands, and closed-cone pine forests. It is cytologically and morphologically variable, with large-flowered forms found in wet places; smaller, scabrous forms found in dry places; forms with rather long pedicels (sometimes recognized as var. lactea); and forms with filaments lacking dilated triangular bases. Most plants have white flowers, but a few interesting forms with restricted distributions have lilac, blue, or even purple flowers. Triteleia ×versicolor Hoover is a sterile hybrid of T. ixioides and T. hyacinthina found in

Taxon Family Spelling Checked

Triteleia ixioides ssp. scabra

Themidaceae !

INFO
Common Name: foothill triteleia, prettyface
Perennial Geophyte
Height: 1ft. Spread: 0.5ft.
Flowers Yellow Spring
Native Range: California: Trinity Co. - Kern Co.
Synonomy: Brodiaea lutea var. s. (Greene) Munz
Not Invasive
Cultivation: Good drainage, dry summers, full sun. Easily grown in a bulb frame or a warm sunny position outdoors[90]. Requires a rich well-drained sandy loam [1]. Likes plenty of moisture whilst in growth followed by a warm dry period in late summer and autumn. Bulbs can flower in 2 years from seed.
Propagation: Seed - best sown as soon as it is ripe in a cold frame. Alternatively, the seed can be sown in spring in a cold frame. Germination usually takes place within 1 - 3 months at 15°c. Sow the seed thinly so that there is no need to prick them out and grow the seedlings on in the pot for their first year. Give an occasional liquid feed to ensure that they do not become mineral deficient. Seedlings are prone to damping off so be careful not to overwater them and keep them well ventilated. When they become dormant, pot up the small bulbs placing about 3 in each pot. Grow them on in the greenhouse for another year or two until the bulbs are about 20mm in diameter and then plant them out into their permanent positions when they are dormant in the autumn. Division of flowering size bulbs in autumn. Dig up the clumps of bulbs, replanting the larger ones direct into their permanent positions. It is best to pot up the smaller ones and grow them on in a greenhouse for a year before planting them out when they are dormant in early autumn.

Notes

12/12/2013 Mona Bourell	Tyler turned in 4 stake AT found loose in 0E2
1/26/2007 Mona Bourell	Jeanne reports temporarily moving from 0E0 to 0A6 to get more sun. Terry may want to plant them out later into Calif. garden. Reinstate accession.
1/2/2007 Mona Bourell	Not found during inventory of Nusery in 2006. Last seen 6 bulbs to be kept in pots for rotating, in unspecified sub-bed in 2004. Deaccessioned due to no active location, 1/2/2007.
5/10/2004 Tony Morosco	Bulbs to be grown in pots (permanently) and shifted out for display when in bloom. Gardeners feel there is too much predation by slugs, snails and other pests to be long lived when planted out in collection.

Taxon Family Spelling Checked

Triteleia laxa

Themidaceae !

image of 1983 C. G. Clear

INFO
Common Name: Ithuriel's Spear
Perennial Geophyte
Height: 1 - 2.5ft. Spread: 0.5ft.
Flowers Purple, Blue, White
Native Range: Calif. - Ore.
Synonomy: Brodiaea laxa (Benth.) S. Wats.
Description: Leaf 20–40 cm, 4–25 mm wide
Inflorescence 10–70 cm, smooth or scabrous; pedicels 20–90 mm
Flower: perianth blue, blue-purple, or white, tube 12–25 mm, lobes 8–20 mm; filaments attached at 2 levels, 3–6 mm, ± equal, linear, anthers 2–5 mm, generally white to bluish; ovary stalk 2–3 X ovary
Chromosomes: n=7,8,14,16,21,24
Ecology: Common. Open forest, woodland, grassland on clay soil
Elevation: 0–1500 m.
Bioregional distribution: Northwestern California, Cascade Range, Sierra Nevada, Central Western California, Transverse Ranges
Distribution outside California: sw Oregon
Highly variable; more study needed
Synonyms: Brodiaea l. (Benth.) S. Watson

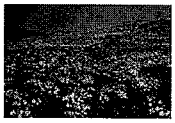

image of 1978 W. Anderson

Cultivation: Fine subjects for rock gardens and open meadows, though most easily protected in large pots. They thrive in full sun or light shade and any reasonably well drained soil. Once the leaves have withered, they need no further watering. Hardy to 10oF or less.
Record Notes: Name checked with The Plant List, 6/29/2011.

Taxon Family Spelling Checked

Trithrinax campestris Arecaceae !

INFO
Common Name: Blue needle palm
Perennial Palm
Height: 20-35ft. Spread: 6-9ft.
Flowers White
Native Range: Argentina
Description: S. Am. temperate; suckers; to 12' ; slow; good potted; ,
stiff leaves.

Usually found with a solitary trunk but also commonly found with multi trunks. Spines on the trunk are a defense system in habitat and can be eight inches long. Has very stiff leaves which could almost be used as a weapon. This palm will tolerate blazing hot weather as well as cold with heavy frosts and strong winds. Very attractive and very desirable by the most discerning collector or gardener. With a maximum height of only 12 feet tall, this would appropriate for even the smallest gardens. Good drainage is a must for this one. Very drought tolerant when established but responds well to regular watering. Bright shade is recommended for trees when young. The fruit may turn a buff yellow when ripe. The fruit is juicy and succulent, having a sweet taste, but is followed by an astringent taste that stays with you like a green persimion. The seeds mature hard and loose inside the exocarp. It's difficult to get the seeds through the winter as the plant blooms in mid to late October and must carry the small, maturing fruit through winter and then the following year. Various growers have had difficulty germinating the seeds. Trithrinax flower has 3 free carpels, 3 sepals, 3 petals and 6 stamens. Transplants easily.

Cultivation: full sun, to 18 deg.F, dry or wet any well drained medium that is neither too acidic or too alkaline. water needs low. Medium salt tolerance

peristant leaves, leaflets very stiff and leathery, tips very sharply pointed and spinelike.

Trochetiopsis ebenus — Malvaceae !

INFO
Common Name: St. Helena Ebony
Perennial Tree
Native Range: St. Helena Island
Description: Mabberly (2002) ponts out that "...T. melanoxylon (R. Br.) Marais extinct since end C18 [18th century], plants rediscovered in 1970 (2 trees left 1993) referred to T. ebenus Cronk now hybridzed with T. erythroxylon in cultivation.

image of © 2006 Tony Morosco, SFBG2001-0157

Endemic to the island of Saint Helena in the southern Atlantic Ocean. It is not related to the ebony of commerce (Diospyros spp.), but is instead a member of the mallow family, Malvaceae. Saint Helena ebony is now critically endangered in the wild, being reduced to two wild individuals on a cliff, but old roots are sometimes found washed out of eroding slopes (relicts of its former abundance). These are collected on the island a used for inlay work, an important craft on Saint Helena. A related species, the dwarf ebony (Trochetiopsis melanoxylon) is now completely extinct.

It is quite easy to propagate from cuttings and many island gardens now boast a fine ebony bush. It is related to the Saint Helena redwood (Trochetiopsis erythroxylon) and a hybrid between them (Trochetiopsis x benjamini) is also now often planted.
Record Notes: Name checked with Tropicos on 11/27/2012 by Mona Bourell.

Taxon | Family Spelling Checked

Trochetiopsis melanoxylon — Malvaceae !

INFO
Common Name:
Perennial Tree
Flowers White
Native Range: St. Helena Island
Synonomy: often hybridized in cultivation.
Description: A very rare evergreen shrub thought to be extinct in the wild. There is some confusion about the proper name. May be T. ebenus. Has deep green, pointed ovate, leaves and large creamy hibiscus like flowers in summer. [http://www.spnurseries.co.uk/Trochetiopsis%20melanoxylon.htm]

Image of © 2007 David W. Kruse-Pickler, SFBG2004

Mabberly (2002) describes "...T. melanoxylon (R. Br.) Marais extinct since end C18 [18th century], plants rediscovered in 1970 (2 trees left 1993) referred to T. ebenus Cronk now hybridzed with T. erythroxylon in cultivation; dead trunks used to burn lime for mortar for fortifications in Napoleonic era & wood from old roots still used in inlay work. Affinities with Madagascar & Mascarenes plants.
Cultivation: Grow in loam based compost with added grit in full light with protection from hot sun. Min 5°C
Record Notes: Name checked with The Plant List; Formerly in the Bombacaceae, which is now part of Malvaceae: http://www.mapress.com/phytotaxa/content/2011/f/pt00019p134.pdf ; 7/6/2011.

Trochodendron aralioides Iseli Clone Trochodendraceae !

INFO
Common Name: Wheel Tree
Perennial Tree
Height: 10-20ft. Spread: 10-15ft.
Flowers not significant Apr, May, Jun
Native Range: Japan
Record Notes: Spelling of scientific name checked in GRIN database 12-17-2005. "Iseli Clone" is believed to be a selection from Jean Iseli, the owner-manager of Iseli Nursery - Boring, OR. Not used as a true cultivar name at current time, but may possibly develop into one if picked up in the nursery trade.

5 specimens on west side of shed, east and west of 2005-0225 Camellia 'Marie'; 3 specimens on northwest, southeast and north side of Magnolia.

Notes

9/2/2008 David Kruse-Pickler: One plant moved from 41G to bed 0C2 by D. Gamez due to tree work being done. Plant to be planted back to this bed. Location record added for 0C2 until planting occurs. Qty in bed 41G reduced from 3 to 2.

2/20/2007 Tony Morosco: 8 plants observed in bed 41: 5 in bed 41I, 3 in 41H. One plant observed to have burgundy/red new growth. Dolores Gamez found an original Nursery tag on one specimen that lists plant at "Trochodendron Iseli". Believe this is the "Iseli clone" of Trochodendron aralioides, and updating name from "Trochodendron aralioides" to "Trochodendron aralioides Iseli Clone" to

3/22/2006 Mona Bourell: Dolores found one loose tag in 41, 3/22/2006.

Trollius 'Golden Queen' Ericaceae !

INFO
Common Name: globeflower
Perennial Herbaceous
Height: 2-4ft. Spread: 1.5ft.
Flowers Orange Aug
Parentage: T. chinensis x T. ledebourii
Description: Bearing a crown of 12 or more narrow vertical petals surrounded by an outer ring of cupped soft orange sepals, this Trollius is known as the "Queen of the Buttercups." Gleaming dark green leaves—serrated, toothed and finely cut—meld a vigorous basal clump that launches the sturdy 3 ft. tall flowering stems in no need of staking.

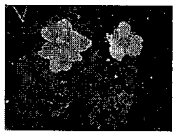

image of © 2009 Mona Bourell, SFBG2009-0342

It dies back at the end of autumn & remnants of foliage may need cutting back after final bloom or it will soon be very tatty.

This hybrid was created from the relatively late-blooming & tender Chinese Globeflower (T. chinensis) crossed with the taller & hardier Ledebour Globeflower (T. lebourii), getting the best traits from both species. This & other globeflower crosses are sometimes sold under the hybrid name T. cultorum.
Cultivation: Requires very moist conditions & is appropriate to the bog garden, thrives in poorly draining clayey soils, but will easily adapt to well-drained soil too. Bred from wildflowers that preferred marshy meadows, it will not tolerate outright dryness.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Cultivar name found used in the trade with internet search, 4/29/2009.

Trollius chinensis Ranunculaceae !

INFO
Common Name:
Perennial
Native Range: China
Description: Stems more than 20 cm tall, to 80 cm at fruiting, simple. Basal leaves 1–4; petiole 12–30 cm, base narrowly sheathed; leaf blade not green when dried, pentagonal, 3.8–6.8 × 6.8–12.5 cm, base cordate, 3-sect; central segment rhombic, 3-fid to or beyond middle, margin densely unequally dentate; lateral segments obliquely flabellate, 2-fid nearly to base. Cauline leaves similar to basal ones, shortly petiolate or sessile. Pedicel 5–9 cm. Flower solitary, or 2 or 3 flowers in a terminal cyme, 3.8–5.5 cm in diam. Sepals (6–)10–15(–19), golden yellow, not green when dried, elliptic-obovate or obovate, 1.5–2.8 × 0.7–1.6 cm, apex rounded. Petals 18–21, narrowly linear, subequaling or longer than sepals, rarely shorter than sepals, 1.8–2.2 cm × 1.2–1.5 mm. Stamens 0.5–1.1 cm. Follicles 20–30, 1–1.2 cm × ca. 3 mm; persistent style ca. 1 mm. Seeds subovoid, ca. 1.5 mm, smooth. Fl. Jun–Jul, fr. Aug–Sep. 2n = 16*.

* Grassy slopes; 1000–2200 m. Hebei, N Henan, W Jilin, W Liaoning, E Nei Mongol, Shanxi.

Trollius europaeus Ranunculaceae !

INFO
Common Name: European globeflower
Perennial Herbaceous
Flowers Yellow
Native Range: Europe
Description: Trollius europaeus grows up to 60 cm high with a bright yellow, globe-shaped flower up to 3 cm across. The colourful petaloid sepals hide 5–15 inconspicuous true petals with nectaries at their base and, typically for the family, a large number of stamens. Each flower produces a large number of wrinkled follicles. The leaves are deeply divided into 3–5 toothed lobes.

It grows in damp ground in shady areas, woodland and scrub, flowering between June and August. It is slightly poisonous and is purgative and rubefacient when used fresh.

This species is pollinated mostly by seed-eating flies belonging to the genus Chiastocheta (Anthomyiidae).

Record Notes: Name checked with The Plant List on 12/31/2013 by Mona Bourell.

Taxon | Family Spelling Checked

Tropaeolum tuberosum — Tropaeolaceae !

INFO
Common Name: Mashua, isanu, cubio, añu, ysaño, puel
Perennial Geophyte
Height: 1.5-3ft. Spread: 3-6ft.
Flowers orange May - Oct
Native Range: South America: Andes
Description: A tuber crop indigenous to the Andean highlands and of economic value as a food and medicinal crop. This root crop ranks fourth in importance in the Andean region after potato, oca, and ulloco (NRC, 1989). Of the Andean tubers, mashua is one of the highest yielding, easiest to grow, and the most frost resistant.

Mashua is cultivated in the Andes of Bolivia, Peru, Ecuador, Columbia, and Venezuela (Gibbs et al., 1978). It is currently being grown experimentally in New Zealand and the Pacific Northwest to evaluate its potential for worldwide cultivation (Soria et al., 1998). The tubers of T. tuberosum are an important source of food for around 9 million people living at elevations of 2500 to 4000 m throughout the Andes mountains (King and Gershoff, 1987).

Mashua is an annual, herbaceous climber that belongs to the family Tropaeolaceae which includes about 100 species. Tropaeolum tuberosum is closely related to the garden Nasturtium, Tropaeolum majus L. (Vaughn and Geissler, 1997). Tropaeolum tuberosum grows to over 1 -1.5 m in diameter and 0.5-0.8 m high with slender and cylindrical aerial stems. Both erect and prostrate forms of mashua are known.

Mashua has alternate, circular, peltate, 3- to 5-lobed leaves, and glaborous, twining stems that attach themselves to other plants by tactile petioles (NRC, 1989). The flowers are long-stalked, solitary, axial, bisexual. The color of the flowers range from dark yellow, orange, and scarlet. The fruit is a schizocarp with three indehiscent carpels that contain joined seeds lacking endosperm (NRC, 1989, Torres et al., 1992). The seeds are abundant and viable at maturity although since mashua is propagated asexually many asexual forms have arose which occasionally set seed.

The tubers of Tropaeolum tuberosum are produced on axillary stolons which enlarge to form terminal, elongate

Tsuga canadensis 'Curly' Pinaceae !

INFO
Common Name: Canada Hemlock
Perennial Shrub
Height: 3ft.
Description: Canadian or eastern hemlock is a dense, pyramidal conifer that is native from eastern Canada south to Maine and Wisconsin and further south in the Appalachian Mountains to Georgia and Alabama. It is typically found in moist woods, wooded ravines, stream valleys, moist slopes and rocky hillsides/ridges. It grows to 75' tall in the wild. Flat sprays of lacy evergreen foliage give this tree a graceful form. Dark green needles (to 9/16" long) with two white bands beneath are arranged in two rows. Needles are attached to twigs by slender stalks. Bark is red-brown to gray-brown. Small, pendant, short-stalked, seed-bearing cones (to 1" long) are tan-brown.

'Curly' is a broad-upright dwarf cultivar whose dark green needles curl around the stems. It typically grows slowly (4" per year) to about 3' tall and as wide over the first 10 years. Branches are brittle.

Cultivation: Grow in average, medium moisture, well-drained soils in part shade to full shade. Site in locations protected from hot afternoon sun. Prefers cool, moist conditions in part shade. Intolerant of drought and should be watered regularly in prolonged dry spells, particularly when plants are young.

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 7/9/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon Family Spelling Checked

Tsuga canadensis 'Pendula' Pinaceae X

INFO
Common Name:
Perennial Shrub
Height: 4-5ft.
Description: This Canadian or eastern hemlock is a weeping evergreen conifer which assumes many different forms depending on how it is grown and pruned.

'Pendula' is often used as a collective name encompassing all weeping hemlock cultivars, including 'Sargentii'. Typically grows 4-5' tall with a spread of 8 -10', but, depending upon how it is pruned, may reach 10-15' tall at full maturity. However, with regular pruning, it can be limited to a 2-3' mound of weeping foliage. Flat, dark green needles to 1/2" long with two whitish bands of stomata underneath. Thimble-like, light brown cones to 3/4" long may appear on older plants. No part of this plant is poisonous. The poisonous hemlocks (Cicuta maculata and Conium maculatum) are herbaceous perennials in the parsley family. Michael A. Dirr considers this weeping form to be "one of the most handsome of all conifers."

Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Tsuga chinensis — Pinaceae !

INFO
Common Name:
Perennial Tree
Height: 150ft.
Native Range: China, taiwan, Tibet, Vietnam
Description: Trees to 50 m tall; trunk to 1.6 m d.b.h.; bark dark gray, longitudinally fissured, flaking; crown pyramidal; branchlets brown-yellow or grayish yellow initially, turning grayish yellow, gray, or brownish gray in 2nd or 3rd year, slender, pubescent; winter bud scales appressed or keeled at base of branchlets. Leaves pectinately arranged, linear, 1.2-2.7 cm × 2-3 mm, abaxial stomatal bands grayish green, margin entire, apex obtuse, entire or emarginate. Seed cones light green, maturing pale gray-yellow or pale brown, ovoid-globose to cylindric or obovoid-oblong, 1.5-4 × 1.2-2.5 cm. Seed scales at middle of cones densely arranged, square-orbicular, pentagonal-ovate, or compressed orbicular, 0.9-1.2 × 0.8-1.1 cm, apex rounded or nearly truncate. Bracts cuneate-obovate or obtriangular, apex erose. Seeds 7-9 mm including obliquely ovate wing. Pollination Apr, seed maturity Oct.

Native habitat: Mountains, mixed forests, valleys, river basins; 1000-3500 m. Anhui, Fujian, S Gansu, Guangdong, Guangxi, N Guizhou, W Henan, W Hubei, Hunan, Jiangxi, S Shaanxi, Sichuan, Taiwan, Xizang, Yunnan, Zhejiang

The timber is used for construction, aircraft, furniture, and in mines. The bark is used for producing tannin, the trunk for resin, and the roots, trunk, and branches for aromatic oils.

Record Notes: Name checked with The Plant List on 7/9/2014 by Mona Bourell.

Taxon Family Spelling Checked

Tsuga heterophylla — Pinaceae !

INFO
Common Name: western hemlock
Perennial Tree
Native Range: Western North America
Synonomy: Abies heterophylla
Description: Trees to 50m; trunk to 2m diam.; crown narrowly conic. Bark gray-brown, scaly and moderately fissured. Twigs yellow-brown, finely pubescent. Buds ovoid, gray-brown, 2.5–3.5mm. Leaves (5–)10–20(–30)mm, mostly appearing 2-ranked, flattened; abaxial surface glaucous with 2 broad, conspicuous stomatal bands, adaxial surface shiny green (yellow-green); margins minutely dentate. Seed cones ovoid, (1–)1.5–2.5(–3) ´ 1–2.5cm; scales ovate, 8–15 ´ 6–10mm, apex round to pointed. 2 n =24.
Coastal to midmontane forests; 0–1500m; Alta., B.C.; Alaska, Calif., Idaho, Mont., Oreg., Wash.
Tsuga heterophylla is a dominant species over much of its broad distributional range. It has become the most important timber hemlock in North America. The wood is superior to that of other hemlocks for building purposes and it makes excellent pulp for paper production.
Tsuga × jeffreyi (Henry) Henry was described from southwestern British Columbia and western Washington as a hybrid between T . heterophylla and T . mertensiana . Hybridization is rare, if it occurs at all, and it is therefore of little consequence (R.J. Taylor 1972). At the upper elevational limits of its distribution and under stressful conditions, T . heterophylla tends to resemble T . mertensiana , e.g., leaves are less strictly 2-ranked and stomatal bands on the abaxial leaf surfaces are less conspicuous than at lower elevations.
Western hemlock (Tsuga heterophylla) is the state tree of Washington.

Tsuga longibracteata — Pinaceae !

INFO
Common Name:
Perennial Tree
Native Range: China
Synonomy: Nothotsuga longibracteata (W.C. Cheng) Hu ex C.N. Page
Description: Trees to 30 m tall; trunk to 1 m d.b.h.; bark dark brown, longitudinally fissured; branchlets drying brownish yellow or reddish brown, aging brown-gray or dark brown, glabrous; winter buds scales keeled abaxially. Leaves with petiole 1-1.5 mm; blade 1.1-2 (-2.4) cm × 1-2(-2.5) mm, smooth or faintly grooved, stomatal lines 7-12 adaxially, 10-16 along each surface abaxially, margin entire, apex somewhat acute or slightly obtuse. Seed cones purplish or red, maturing to dark brown, 2-5.8 × 1.2-2.5 cm, persistent for several years, then breaking off whole or sometimes disintegrating. Seed scales at middle of cones broadly rhombic or suborbicular, 0.9-2.2 × 1.2-2.5 cm, base peltate-auriculate, apex truncate-rounded. Bracts subspatulate, 0.7-1.8 cm, apical cusp acute or acuminate. Seeds triangular-ovoid, 4-8 × 2.5-3 mm; wing ovate-oblong, apex rounded. Pollination Mar-Apr, seed maturity Oct.

* Forming small, pure stands, or in evergreen, broad-leaved, sclerophyllous forests (species of Castanopsis, Lithocarpus, and Quercus), or mixed, mesophytic forests (Fagus longipetiolata, Pinus kwangtungensis, Tetracentron sinensis, etc.) on steep, sunny mountain slopes and ridges on acidic soils in areas with cool, temperate, humid climate and abundant rainfall and fog; (300-)400-1900(-2300) m. C and S Fujian, N Guangdong, C and N Guangxi, E Guizhou, S Hunan, S Jiangxi

A vulnerable species; few trees survive in most populations because of large scale logging. R. R. Mill concurs with Page and other recent authors that this species is sufficiently distinct to be treated in its own genus as Nothotsuga longibracteata. It differs strikingly from other species of Tsuga as follows: leaves radially spreading, stomatal lines present on each surface; pollen cones clustered in umbels from a single lateral

Tsuga sieboldii 'Greenball' — Pinaceae !

INFO
Common Name: Japanese hemlock
Perennial Shrub
Description: Small, mounding slow growing dwarf conifer with short dark green foliage. 2.5 x 2.5' in 10 years.

Sieboldii hemlocks are from the mountains of southern Japan. Very few cultivars are available in America. Mini Forest is fortunate to offer this very rare plant. Perfect for rock gardens, small-scale scenes, collector's garden and Mame Bonsai. Prefers partial to full shade. Cool, moist soil but well drained.

Cultivation: Full to part shade. Moist soil. Evergreen Zone 5-9.
Record Notes: Name checked with The Plant List on 4/22/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Tulbaghia violacea Liliaceae !

INFO
Common Name: Society Garlic
Perennial Geophyte
Height: 1-1.5ft. Spread: 2ft.
Flowers Pink, Purple Jun, Jul
Native Range: South Africa
Description: An evergreen, clumping perennial related to true garlic (Allium) but grown for ornament. It has erect grasslike, bluish green leaves, smelling of garlic when bruised, and displays a nearly perpetual succession of clustered lavender pink blossoms on slender 1' stems. The cultivar 'Silver Lace' is interesting for its dwarfer habit and cream-margined leaves. Good plants for containers and rock gardens. Sun, well drained soil, moderate watering. Hardy to 20oF or below, though the leaves are damaged by frost.
Cultivation: Plant the corms of this lovely plant in October, or goring plants any time of year 12 inches apart. Fertilize to enhance blossom. Sun, well drained soil, moderate watering. Hardy to 20oF or below, though the leaves are damaged by frost.
Propagation: Seeds or divisions

Notes

Tulbaghia violacea 'Silver Lace' Liliaceae !

INFO
Common Name: Variegated Society Garlic
Perennial Geophyte
Height: 1ft. Spread: 2ft.
Flowers Pink, Purple Spring - Fall
Native Range: South Africa
Synonomy: Tulbaghia violacea 'Variegata'
Description: An evergreen, clumping perennial related to true garlic (Allium) but grown for ornament. It has erect grasslike, bluish green leaves which a white-yellow stripe, smelling of garlic when bruised, and displays a nearly perpetual succession of clustered lavender pink blossoms on slender 1' stems. The cultivar 'Silver Lace' (a.k.a. 'Variegata') is interesting for its dwarfer habit and cream-margined leaves. Good plants for containers and rock gardens.
Cultivation: Plant the corms of this lovely plant in October, or goring plants any time of year 12 inches apart. Fertilize to enhance blossom. Sun, well drained soil, moderate watering. Hardy to 20oF or below, though the leaves are damaged by frost.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Tulipa humilis Liliaceae !

INFO

Common Name: red crocus tulip
Perennial Geophyte
Flowers Variable
Native Range: Turkey, Iran, and the Caucasus
Description: Tulipa humilis is a species from southeastern Turkey, Iran, and the Caucasus that is variable in color and form. The humilis complex grows on mountain slopes often near the snowline. Members of this complex are T. violacea, T. pulchella, T. kurdica and T. lownei. T. humilis in gardens is the name given to a dwarf tulip with nice pink flowers and a yellow center. The flowers have a sweet yet peculiar clay-like earthen scent.

Record Notes: Name checked with The Plant List, 2/28/2011.

Tulipa humilis 'Violacea'

Liliaceae !

INFO

Common Name: Red Crocus Tulip
Perennial Geophyte
Flowers purplish rose Feb
Description: Syn: The Red Crocus Tulip. Circa 1860, this purplish-rose tulip has a yellow base and greenish-yellow anthers. Bulb size: 5 to 6 cm. Early April. 4" to 6".

'Violacea' is a naturally occuring variant of T. humilis, this variant having been discovered in Kurdistan. It is a dwarf botanical, called a crocus-tulip because of its ultra-short stature & early bloom.

Taxon Family Spelling Checked

Tulipa kolpakowskiana

Liliaceae !

INFO

Common Name:
Perennial Geophyte
Height: 8 inchesft.
Flowers Yellow with red streaks
Native Range: Central Asia
Description: It is native of Central Asia, found in Uzbekistan, Turkestan, Kyrgyzstan, & Afghanistan from northern Tien Shan to southern Ala Tau.

The overall appearance has considerable variation & bulbs from completely different sources will look a bit different from one another. But overall, the interior of the slender-petalled cups are a very pure color; even the anthers are yellow. The outer petals on ours are flushed with a bit of red, but some strains have quite a bit more red on the outside, & sometimes they are more yellow-green than yellow on the outside.

Some of the bulbs produce two or three flower stems instead of just the one, so a drift with only a few bulbs can look rather flowery from the start. They stand a half-foot tall, to eight inches at tip of flower.

The buds are at first nodding, but by the time they open, they are upright little fellows. This tulip is a recipient of the Award of Garden Merit.

Cultivation: The sunny Tulipa kolpakowskiana is quite an easy species tulip to grow in any well-drained soil with plenty of sun morning & afternoon.

Record Notes: Name checked with The Plant List, 2/28/2011.

Tulipa linifolia

Liliaceae !

INFO

Common Name:
Perennial Geophyte
Flowers Red with purple
Native Range: Uzbekistan & Afghanistan
Description: This species tulip blooms in mid- to late spring with fire-engine-red flowers that look like open, pointed stars with purple centers. It reaches 4-6 inches tall and not quite as wide. Species tulips prefer sharp drainage and plenty of room to grow; they will often naturalize. Most do well in rock gardens, small displays, and containers.
Noteworthy characteristics: Tulips originate from Central Asian regions with cold winters and dry summers, and they require a cold treatment in order to bloom. They are invaluable for early spring color in bedding schemes, parterres, cottage gardens, and mixed borders. This speices is also suitable for rock gardens.

Cultivation: Care: Provide fertile, well-drained soil in full or afternoon sun. In autumn, plant to a depth of two and a half times the height of the bulb; in regions warmer than zone 8, bulbs will need a cold treatment (40° to 45°F for 8-10 weeks).

Problems: Bulb and root rot, gray mold, slugs, snails, aphids, nematodes, voles.

Propagation: Propagation: Impractical for home gardeners.
Record Notes: Name checked with The Plant List on 1/31/2012 by Mona Bourell.

Tulipa tarda Liliaceae !

INFO
Common Name:
Perennial Geophyte
Flowers Yellwo, greenish, creamy white
Native Range: Kyrgyzstan
Synonomy: Tulipa urumiensis Stapf
Description: Tulipa tarda Stapf
[(subgenus Eriostemones)]

Plant 5-15 cm, stem dark green. Leaves in rosette, 3-7, sulcate, light green, linear-lanceolate. Flowers 1-7, 3-5 cm in diam., stellate, white with yellow base. Outer segments green, creamy-margined outside. Filaments and anthers yellow. V - early spring to mid-spring. Fl - March (in St. Petersburg April). Fr - June. P - freely vegetatively, also self-sowing. Does well on any soil, very persistant.

Central Asia (northern Tien Shan). Stony and debris slopes.

Cultivation: Can live for many years in the same place, once established. Full sun, also partial shade. Good for any spring decoration. Many years in cultivation. Z 4 (3).

Typha angustifolia Typhaceae !

INFO
Common Name: narrow-leaved cattail
Perennial Graminoid
Native Range: N America , Eurasia
Synonomy: Typha angustifolia var. calumetensis, Typha angustifolia var. elongata
Description: Erect shoots 150--300 cm, not glaucous; flowering shoots 5--12 mm thick in middle; stems 2--3 mm thick near inflorescence. Leaves: sheath sides membranous, margin broadly clear, summit with membranous auricles which often disintegrate late in season; mucilage glands at sheath-blade transition brown, absent from blade and usually from sheath center near summit; widest blades on shoot 4--12 mm wide when fresh, 3--8 mm when dry; distal blade usually markedly exceeding inflorescence. Inflorescences: staminate spikes separated from pistillate by 1--8(--12) cm of naked axis, ca. as long as pistillate, 1 cm thick in anthesis; staminate scales variable in same spike, straw-colored to medium brown, filiform, simple to bifid or sometimes cuneate and irregularly branched, to 6 □ 0.1 mm; pistillate spikes in flower when fresh dark brown with whitish stigmas (drying brown), later medium brown, in fruit when fresh as stigmas wear off often greenish due to green carpodia, (4--)6--20 cm □ 5--6 mm in flower, 13--22 mm in fruit; compound pedicels in fruit peg-like, 0.5--0.7 mm; pistillate bracteole blades forming spike surface before flowering, later exceeded by stigmas and about equaling or slightly exceeded by pistil hairs, very dark to medium brown, much darker than (or sometimes as dark as) stigmas, irregularly spatulate, 0.6 □ 0.1--0.2 mm, wider than or about as wide as stigmas, apex rounded (to acute). Staminate flowers 4--6 mm; anthers 1.5--2 mm, thecae yellow, apex dark brown; pollen in monads or some in irregular clusters. Pistillate flowers 2 mm in flower, 5--7 mm in fruit; pistil-hair tips medium brown, distinctly swollen at 10--20X; stigmas sometimes deciduous in fruit, in flower erect, elongating, bending to form surface mat, white in flower, drying brownish, later medium brown, narrowly linear-lanceolate, 0.6--1.4 □ 0.1 mm; carpodia slightly exceeded by and visible among pistil hairs at mature spike surface, green when young and fresh, straw-colored with orange-brown spots when dry, apex nearly truncate. 2n = 30.

Typha latifolia Typhaceae !

INFO
Common Name: broad-leaved cattail, tule
Perennial Graminoid
Native Range: temperate N.America, C.America, Eurasia, Africa

Description: Erect shoots 150–300 cm; flowering shoots 1–2 cm thick in middle, stems 3–7 mm thick near inflorescence. Leaves: usually glaucous when fresh; sheath sides papery or membranous, margins narrowly clear, summit tapered into blade to distinctly shouldered, or rarely with firm, papery auricles; mucilage glands at sheath-blade transition usually colorless, obscure, absent from sheath center and blade; widest blades on shoot 10–23(–29) mm wide when fresh, 5–20 mm when dry, distal blades about equaling inflorescence. Inflorescences: staminate spikes contiguous with pistillate or in some clones separated by to 4(–8) cm of naked axis, about as long as pistillate, ca. 1–2 cm thick at anthesis; staminate scales colorless to straw-colored, filiform, simple, ca. 4 □ 0.05 mm; pistillate spikes in flower pale green drying brownish, later blackish brown or reddish brown, in fruit often mottled with whitish patches of pistil-hair tips, 5–25 cm □ 5–8 mm in flower, 24–36 mm thick in fruit; compound pedicels in fruit bristle-like, variable in same spike, 1.5–3.5 mm; pistillate bracteoles absent. Staminate flowers 5–12 mm; anthers 1–3 mm, thecae yellow, apex dark brown; pollen in tetrads. Pistillate flowers 2–3 mm in flower, 10–15 mm in fruit; pistil-hair tips colorless, whitish in mass, not enlarged; stigmas persistent, forming solid layer on spike surface, pale green in flower, drying brownish, then reddish brown or usually distally blackish, spatulate, ovate to ovate-lanceolate, 0.6–1 □ 0.2–0.25 mm; carpodia exceeded by and hidden among pistil hairs, straw-colored, apex rounded. Seeds numerous. 2n = 30.
Flowering late spring–summer in north, spring–early summer in south. Fresh to slightly brackish water or wet soil; 0–2300 m; Alta., B.C., Man., N.B., Nfld. and Labr. (Nfld.), N.W.T., N.S., Ont., P.E.I., Que., Sask., Yukon; Ala., Alaska, Ariz., Ark., Calif., Colo., Conn., Del., Fla., Ga., Idaho. Ulmus davidiana — Ulmaceae !

INFO
Common Name:
Perennial Tree
Native Range: China
Description: Trees or shrubs, to 15 m tall, d.b.h. to 30 cm, deciduous. Bark longitudinally fissured. Branchlets pubescent when young, glabrescent or ± pubescent, sometimes with irregularly longitudinally fissured corky layer. Winter buds ovoid; bud scales partly pubescent. Petiole 5-10(-17) mm, pubescent; leaf blade obovate to obovate-elliptic, 4-9(-10) × 1.5-4(-5.5) cm, abaxially densely pubescent when young but glabrescent with tufted hairs only in axil of veins, adaxially sparsely hirsute when young but glabrescent, base oblique, margin doubly serrate, apex caudate-acuminate to acuminate; secondary veins 12-22 on each side of midvein. Inflorescences fascicled cymes on second year branchlets. Perianth glabrous, 4-lobed. Samaras tan, obovate to ± obovate, 1-1.9 × 0.7-1.4 cm; stalk pubescent, ca. 2 mm; wings usually glabrous. Seed toward apex and in center of samara.

Slopes, wetlands near streams, valleys; below 2300 m. Anhui, Gansu, Hebei, Heilongjiang, Henan, Hubei, Jilin, Liaoning, Nei Mongol, Ningxia, E Qinghai, Shaanxi, Shandong, Shanxi, Zhejiang [Japan, Korea, Mongolia, Russia (Far East, E Siberia)].

Bark pale gray to gray; samara densely pubescent over seed.

Ulmus procera — Ulmaceae !

INFO
Common Name: English Elm
Perennial Tree
Height: 60-80ft. Spread: 50-70ft.
Native Range: Europe
Description: This is a large tree native of England and Europe. It reaches heights of 60—80 feet. Like most elms, it is urban-tolerant. English elm grows in an upright, oval configuration. This is quite different than the habit of the native American elm with its vase shape. The state champion English elm is on the Columbus campus of The Ohio State University and is 100 feet high and 70 feet across. European elms are as sensitive to Dutch elm disease and elm yellows as are the American elms, though the American elms are more resistant to the elm-leaf beetle than English elm. The English elm suckers freely.

The leaves are dark green and remain on the tree late into the fall. Growing only 2—3l/4 inches (5—81/2 cm) in length, the foliage is smaller than many other elms. Leaves are dark green and rough above but soft and hairy below.

Terminal buds are absent. One-year-old twigs are very hairy. Bark is dark and deeply ridged. The small branches are rough and usually covered with fine hairs. Bark on the main stems is dark and deeply plated, lacking the vertical orientation of the furrowed bark of many elms.

Umbellularia californica — Lauraceae !

INFO
Common Name: California Bay, California laurel, bay tree, Oregon Myrtle, California laurel, Bay laurel
Perennial Tree
Height: 20-40ft.
Native Range: Western North America
Synonomy: Tetranthera californica Hooker & Arnott
Description: Trees or shrubs , to 45 m; twigs terete, glabrous or sparsely appressed-pubescent, rarely minutely tomentose. Leaf blade deep yellow-green, shiny, narrowly oblong or narrowly elliptic, 3-10 × 1.5-3 cm, base acute or obtuse, apex acute; surfaces abaxially glabrous, sparsely appressed-pubescent or minutely tomentose, adaxially glabrous; domatia absent. Inflorescences pubescent. Flowers 5-10; tepals 6-8 mm. Drupe usually solitary, 2 cm or more diam. 2 n =24.

image of 1970 Strybing Arboretum Society

image of http://elib.cs.berkeley.edu/cgi/img_query?

Varieties 2: w coast, North America.

Native Americans used Umbellularia californica for medicinal purposes and occasionally as an insecticide (D. E. Moerman 1986).

Cultivation: It likes sun in the mountains and along the coast where the rainfall is above 30 inches/year. In the interior give part shade and moderate water. Some ecotypes tolerate serpentine soil. No cold damage at 10 deg., burnt to the ground at 0.Easy to hold at 6-8'. Good in containers.

Intended for use in: Mesoamerican Cloud Forest

Notes

12/23/2008 Mona Bourell — Probably equals 1999-0148, which was originally labeled B. dulcis, then B. nitida.

10/24/2008 Mona Bourell — Deaccession this record, 10/24/2008. No active location known. Supposedly planted in NE corner of 25A across path from stairs on 12/3/2004, last checked 2005, #6 on bed inventory map.

10/24/2008 Mona Bourell — 2/18/2008, From Jason Dewees: " The plants in Bed 25A & 25B, one labeled Brahea dulcis, are actually Brahea nitida. The seed Inge Hoffmann sent me was mislabeled. A fourth plant with only two leaves that is very likely from the same cohort has recently been moved into proximity to the healthier three but across the asphalt path in 26D. I believe what may have happened

2/7/2008 Mona Bourell — When Mona and Arlene went to place tag and sign, found 2 unmarked palms in this area that look identical to Brahea dulcis 1999-0148, plant in 25B. Patrick thinks they are all the same, in addition to the one across the path in 26D. This number to be deaccessioned ? Confirm ID with palm expert, Jason Dewees.

6/24/2004 Tony Morosco — Three tags in pot: South Coast Palms Tag "Brahea dulcis...", Another tag: "Brahea aculeata", orange tag: "Jason Dwees suspects this may be Trachycarpeis"

Taxon Family Spelling Checked

Undetermined Gleicheniaceae — Gleicheniaceae X

INFO
Common Name:
Perennial Herbaceous
Description: Gleicheniaceae are terrestrial ferns comprising about half a dozen genera and 120 species found mainly in tropical and subtropical regions. The sporophyte consists of long, creeping rhizomes with vining aerial leaves that fork pseudodichotomously due to periodic arrested growth of the main axis. The leaves may occasionally reach several meters in length and commonly form a tangled mass in open habitats. The rhizomes bear long, uniseriate hairs. The leaf axis and rhizome have a single central "c"-shaped vascular bundle. The pear-shaped, more or less sessile sporangia have up to 128 spores and are borne in naked, circular sori.

ACCESSION **SFBG# 2006-0210 DEACCESSIONED** Rec'd: 3/16/2006

Ursinia anethoides 'Solar Fire' Asteraceae !

INFO
Common Name: Dill-Leaf Ursinia
Annual Herbaceous
Height: 1-2ft. Spread: 1-2ft.
Flowers Yellow, Red
Native Range: South Africa
Synonomy: Sphenogyne anethoides DC.
Description: Serious bang for the buck! I'm amazed that this extremely floriferous, fast & easy South African annual is not more popular in the trade & with garden designers. Quickly growing to 15" tall & wide, it explodes into a mass of sunny, golden blooms that last for months. With a rich, shiny maroon ring encircling the central golden eye, the 2-1/2" flowers are eye-fetching held atop the rich green mound of ferny foliage. Combine this high performance annual with gentian blue Anagallis monellii for striking color contrast. Heat & drought tolerant once established, Ursinia anethoides will easily self-sow for many return engagements. Here in USDA Zone 10 it can be planted at any time of the year (blooming shortly thereafter), & makes a good Winter bloomer too. Excellent in a container too - at least 10" across. [anniesannuals.com]
Cultivation: Sun; Avg./Low water
Record Notes: Spelling of scientific name checked in TROPICOS 4/3/2006.

ACCESSION **SFBG# 2006-0234 DEACCESSIONED** Rec'd: 4/3/2006
Source: Annie's Annuals

Vaccinium bracteatum Ericaceae !

INFO
Common Name:
Native Range: China+japan
Description: Shrubs or small trees, evergreen, 2–6(–9) m tall, much branched. Twigs inconspicuously angled, pubescent or glabrous; bud scales inconspicuous. Leaves scattered; petiole 2–8 mm, puberulous or glabrous; leaf blade elliptic, rhombic- or lanceolate-elliptic, or lanceolate, rarely obovate, (1.1–)4–9 × (0.7–)2–4 cm, thinly leathery, glabrous, secondary veins 5–7 pairs, barely raised, fine veins conspicuous or not, base cuneate, broadly cuneate, or obtuse, margin plane, denticulate, apex acute, acuminate, rarely rounded or long acuminate. Inflorescences pseudoterminal, racemose, 4–10 cm, densely pubescent, rarely glabrous, many flowered; bracts persistent or caducous, leaflike, lanceolate, 0.5–2 cm. Pedicel ca. 4 mm, densely pubescent or subglabrous. Hypanthium densely pubescent or tomentellate, rarely subglabrous; calyx limb ca. 1 mm, triangular-toothed. Corolla white, rarely reddish, tubular or slightly urceolate, 5–7 mm, densely pubescent; lobes reflexed, triangular. Filaments 2–2.5 mm, densely pilose; anthers 2–2.5 mm, without spurs; tubules 2–2.5 × as long as thecae. Berry 10-pseudoloculed, dark purple, pubescent. Fl. Jun–Jul, fr. Aug–Oct.

Leaf blade 4–9 × 2–4 cm.
+ Leaf blade 1–4 × 0.7–1.4 cm.

Forests, thickets, grassy places at roadsides; 400–1500(–1900) m. Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Hunan, Jiangsu, Jiangxi, Sichuan, Taiwan, Yunnan, Zhejiang [Cambodia, Indonesia, S Japan, Korea, Laos, Malaysia, Thailand, Vietnam].

This species is used medicinally and to stain cooked rice.

Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native

8/21/2013 Marc Johnson	2 plant(s) found in bed 24E by Marc Johnson during inventory, 8/20/2013. Previous qty was 1, last checked: 11/17/2009 Volunteer Lisa Roberts. Location notes: North side of bed along foot path, middle to west side. #25 on bed inventory map.. Qty updated from 1 to 2.
6/24/2013 Marc Johnson	4 plant(s) found in bed 25A by Marc Johnson and Patrick Quinn during inventory, 6/13/2013. Previous qty was 3, last checked: 11/3/2008 Patrick Quinn. Location notes: Facing magnolia sharpii vaccinium to the left; #69 & 70 on bed inventory map; toward SW of of center of bed.. Qty updated from 3 to 4.
11/1/2012 Marc Johnson	Location 24G removed from database by Marc Johnson on 11/1/2012 Reason: Not found during inventory, 8/14/2012 by Marc Johnson and Patrick Quinn. Location Details at time of removal: Bed: 24G (Mesoamerican Cloud Forest) # Plants: 2 Planting Date: 4/1/1993 Last Checked: 4/21/2006 Patrick Quinn Location Notes: Location ID: 8339
12/8/2009 Mona Bourell	During spot check inventory of 29C on 11/10/2009, Patrick is unsure if tis plant exists. Last checked here, 2 on 4/19/2006. Location removed at this plant.
4/21/2006 Mona Bourell	Patrick reports planting out 2 plants from 0C1 to 29C, 4/19/2006.
10/18/2005 Tony Morosco	One plant without accession tag, with orange plant sale label (with accession number written on it) found in bed 0B1. Presume this is same plant listed in bed 0C1 last checked 10/14/2004 because there is no accession tag order. Ordered accession tag.
12/10/2003 Tony Morosco	One plant found in Asian part of Nursery. Moved to Mesoamerian section of nursery.

Taxon | Family Spelling Checked

Vaccinium corymbosum 'Jubilee' — Ericaceae !

INFO
Common Name: blueberry
Perennial Shrub
Height: 4-5ft.
Flowers White
Description: Highbush blueberry.
Deciduous. This selection has shown ability to perform well in heavier soils through summer heat, as well as having resilience to sudden winter cold. Medium to large, sky-blue, very sweet fruit ripens over a two to three week period from late summer through fall. Attractive blue-green foliage has bright yellow-orange fall color. Evergreen in mild climates
Cultivation: Cold hardiness zones: 5 - 9
Light needs: Full sun
Water Needs: Needs regular watering - weekly, or more often in extreme heat.
Average landscape size: Upright, compact bush 4 to 5 ft. tall.
Growth rate: Moderate
Record Notes: Name checked with The Plant List on 9/12/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Notes

Vaccinium corymbosum 'Misty' — Ericaceae !

INFO
Common Name:
Perennial Shrub
Description: Highbush blueberry.
Misty is one of the most attractive, vigorous and high yielding Southern Highbush varieties. The bright blue-green foliage provides a perfect contrast to the pink and white spring flowers and sky blue summer fruit. Yields best when planted with other varieties. Chilling needs are very low at 300 hours, but don't hesitate to offer it all the way to Seattle.
Record Notes: Name checked with The Plant List on 9/12/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Vaccinium delavayi — Ericaceae !

INFO
Common Name:
Perennial
Native Range: China
Description: Shrubs evergreen, terrestrial or epiphytic, prostrate, or 0.5–1 m tall, many branched; rootstock swollen. Twigs angled, grayish brown pubescent and brown glandular setose; bud scales inconspicuous. Leaves dense; leaf blade obovate, 0.7–1.5 cm × 4–9 mm, leathery, glabrous, secondary veins ca. 3 pairs, inconspicuous abaxially, impressed adaxially, base cuneate, margin plane, cartilaginous, with 1 basal gland per side, sparsely denticulate or subentire, usually sparsely deciduously glandular ciliate, apex rounded, retuse. Inflorescences pseudoterminal, racemose, 1–3 cm, pubescent and glandular setose, 4–8-flowered; bracts caducous, ovate, 5–6 mm. Pedicel 2–4 mm, pubescent and glandular setose. Hypanthium ca. 1 mm, glabrous; calyx limb divided to 1/2; calyx lobes broadly triangular, ca. 0.8 mm, ciliate. Corolla white or pinkish, urceolate, 3–5 mm, glabrous; lobes erect, ca. 0.7 mm. Filaments ca. 1 mm, subglabrous or retrorse-pilose; anthers ca. 2.3 mm, thecae with 2 spreading spurs; tubules ca. as long as thecae. Berry 10-pseudoloculed, dark purple, 4–8 mm in diam. Fl. Mar–May.

Filaments subglabrous.

Forests, Tsuga-Rhododendron forests, sometimes epiphytic on trees, alpine Rhododendron thickets, ridges, dry slopes, rocks; 2000–3700(–3800) m. SW Sichuan, Taiwan, SE Xizang, Yunnan [Myanmar].

Taxon | Family Spelling Checked

Vaccinium gaultheriifolium — Ericaceae !

INFO
Common Name:
Perennial Shrub/tree
Height: 6ft.
Flowers Pink or red [white] Nov
Native Range: Bhutan, Nepal, India, Myanmar, China
Description: Shrubs evergreen, 2–4 m tall, sometimes epiphytic. Twigs glabrous; bud scales caducous. Leaves scattered; petiole 4–6 mm; leaf blade elliptic, 7–13 × 4–6.5 cm, leathery, abaxially glaucous, glabrous or sparsely glandular setose on midvein, adaxially glabrous, secondary veins 5–8 pairs, fine veins raised on both surfaces, base broadly cuneate to obtuse, decurrent, margin plane, entire or sparsely glandular setose, with 1–3 basal glands per side, apex shortly acuminate. Inflorescences racemose, 2–3.5 cm, glabrous, 8–13-flowered; bracts caducous, elliptic, ca. 1.2 cm. Pedicel 4–12 mm, expanded towards apex; bracteoles caducous, linear, 5–6 mm. Hypanthium glabrous, glaucous; calyx limb 0.7–1 mm, triangular-toothed nearly to base. Corolla pink or red, urceolate, 6–11 mm; lobes ca. 1 mm. Stamens ca. as long as corolla; filaments ca. 1.5 mm, densely pubescent; anthers ca. 3 mm, with 2 erect spurs; tubules ca. as long as thecae or shorter. Style puberulous apically. Berry 10-pseudolocuted, dark purple, with a bloom, 8–9 mm in diam.
Forests, forest margins, sometimes epiphytic on trees, thickets on stony mountain slopes, slopes; 1200–2600 m. SE Xizang, NW and SE Yunnan [Bhutan, NE India, Myanmar, Nepal, Sikkim].

Cultivation: Hardiness: Unknown, but would appear to be hardy to at least short freezes. Hardy to about 15 deg. F.
Growing Environment: The plant does well in subtropical and warm-temperate climates. Outside of these areas it is unstudied. Water regularly and plant in well-drained soil. Once established it needs minmal care. Grows well in part-sun and full sun, though its probably most at home with shade during some of the day.
Propagation: By seed.
Record Notes: Name checked in Flora of China, 4/21/2008.

Taxon Family Spelling Checked

Vaccinium moupinense — Ericaceae !

INFO
Common Name: Himalayan Blueberry
Perennial Shrub/epiphytic
Height: 1-3ft. Spread: 1-3ft.
Flowers Red, Brown Spring
Native Range: China: western Sichuan
Synonomy: Vaccinium sikangense Y. C. Yang (Flora of China)
Description: Shrubs evergreen, epiphytic, 0.5–1.2 m tall, many branched. Twigs rounded, densely grayish pubescent, glabrescent; bud scales inconspicuous. Leaves dense; petiole 1–2 mm, pubescent; leaf blade elliptic, obovate-elliptic, or obovate-oblong, 0.7–1.7 cm × 4–8 mm, leathery, abaxially glabrous, adaxially drying rugose, sparsely pubescent or only puberulous on midvein, secondary veins ca. 3 pairs, ± ascending, secondary and fine veins conspicuous abaxially only, base cuneate, margin revolute, with inconspicuous obtuse teeth in upper part, apex obtuse to rounded. Inflorescences often pseudoterminal, racemose, 1.5–3 cm, glabrous, 6–15-flowered; bracts caducous, broadly ovate, 5–6 mm. Pedicel 3–4 mm, glabrous. Hypanthium ca. 1.5 mm, glabrous; calyx limb divided to 2/3; calyx lobes broadly triangular, ca. 1 mm. Corolla light purple to rose-pink, urceolate, ca. 4 mm, glabrous; lobes erect or reflexed, ca. 0.8 mm. Filaments ca. 1 mm, hairy; anthers ca. 3 mm, thecae with 2 spreading spurs; tubules ca. as long as thecae. Berry 10-pseudolocuied, black or black-purple, ca. 6 mm in diam. Fl. May–Jun, fr. Jul–Oct.
Native habitat: Epiphytic on Quercus or Tsuga; (900–) 1800–2400 m. Guizhou, WC Sichuan (Baoxing), NE Yunnan.

. Grows slowly with a dwarf stature, one to two foot range of height & width, small & very compactly leafed.
Cultivation: It has its best leaf colors in full sun especially when grown on the coast or farther north, but will also do nicely in partial shade & will require a bit of shade grown inland. Its first year it needs very regular watering, especially if placed in a good deal of sun, but eventually develops an extensive root system & becomes surprisingly drought tolerant. It's cold-hardy to zone 5.
Record Notes: Name checked with The Plant List on 12/12/2011 by Mona Bourell.
Name spell checked in TROPICOS 2/22/2006

Vaccinium oldhamii — Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers Pink
Native Range: E. China, Korea, Japan
Synonomy: Vaccinium oldhami
Description: Shrubs deciduous, 1–3 m tall. Twigs terete, angled, densely pubescent and with scattered glandular hairs, glabrescent; bud scales inconspicuous. Leaves scattered; petiole 1–3 mm, pubescent, with intermixed glandular hairs; leaf blade ovate, elliptic, or oblong, 2.5–8 × 1.2–4.5 cm, papery, abaxially setose or glandular setose on veins, otherwise appressed-setose or glabrous, adaxially pubescent on veins, otherwise appressed-setose or glabrous, secondary veins (5–)7 or 8 pairs, secondary and fine veins raised abaxially, slightly raised or flat adaxially, base cuneate, broadly cuneate, or rounded, margin plane, denticulate, glandular setulose at tips of teeth, apex acute. Inflorescences terminal, racemose, 3–6 cm, pubescent, with intermixed glandular hairs, (1–)9–17-flowered; bracts ovate-lanceolate to linear, 2.5–7 mm. Pedicel ca. 1.5 mm, glandular pubescent. Hypanthium glandular pubescent; calyx lobes triangular, ca. 1.5 mm, ciliate. Corolla pinkish, campanulate, 3–5 mm, glabrous; lobes ca. 0.5 mm. Filaments ca. 1.5 mm, pilose in upper part; anthers ca. 1.7 mm, thecae without spurs; tubules ca. 1/2 as long as thecae. Berry 10-pseudolocuted, dark purple, subglobose, 0.7–1 cm in diam. Fl. May–Jun, fr. Jul–Oct.
Native habitat: thickets on mountain slopes; 200–700(–1300) m. N Jiangsu, Shandong [Japan, Korea].

Record Notes: Name checked with IPNI, Flora of China, 4/15/2010.

Vaccinium ovatum 'Wunderlich' Ericaceae !

INFO

Common Name:
Perennial Palm
Height: 4-8+ft. Spread: 4-8ft.
Flowers White
Description: Evergreen huckleberry. An exceptionally vigorous, large leaved form of this ornamental native, selected by Suzanne Schettler. It forms a thicket of closely branched stems, rising to 8' or more. Each is lined by oval, shiny 1" leaves. The leaves are red to bronze in new growth, dark green when mature. Small white flowers dot the branches in spring, developing slowly into sweet, slightly tart, blue-black berries.
Cultivation: Average moisture
Light Requirements Full Shade, Part Sun/Part Shade, Full Sun
Soil Conditions Well-drained
Additional Features Plants to attract wildlife. Attracts birds
Record Notes: Name checked with The Plant List on 9/9/2013 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Vaccinium retusum Ericaceae !

INFO
Common Name:
Perennial Shrub
Flowers White
Native Range: Bhutan, India, Myanmar, Nepal, China
Description: Shrubs dwarf, evergreen, often epiphytic, ca. 30 cm tall. Twigs diffuse, angled, densely pubescent when young, glabrescent. Leaves dense; petiole 2–3 mm, pubescent; leaf blade elliptic or obovate, 2–2.5 × 0.9–1.4 cm, leathery, adaxially puberulous on midvein, otherwise glabrous on both surfaces, secondary veins 2 or 3 pairs, ascending, slightly raised abaxially, inconspicuous adaxially, base cuneate, margin cartilaginous, revolute, entire, with 1 basal gland per side, apex rounded, retuse. Inflorescences pseudoterminal, racemose, 3–5 cm, ca. 12-flowered; rachis densely pubescent to glabrous; bracts ovate-orbicular, ca. 1.1 cm. Pedicel ca. 3 mm, glabrous. Hypanthium ca. 1.3 mm, glabrous; calyx lobes 0.8–1 mm, with marginal hairs. Corolla white, with 5 red stripes abaxially, urceolate, ca. 0.5 mm; lobes small. Stamens shorter than corolla, pilose; filaments ca. 0.5 mm; anthers ca. 3 mm, with 2 erect spurs; tubules ca. as long as thecae. Berry 10-pseudolocuted, black-purple, ca. 5 mm in diam. Fr. Jun.
Epiphytic or on rocks; ca. 2500 m. S Xizang, Yunnan [Bhutan, NE India, Myanmar, Nepal, Sikkim].
The above description of the flower follows that in the protologue and that by Clarke in Fl. Brit. India.

Vancouveria hexandra Berberidaceae !

INFO
Common Name: white inside-out flower
Perennial Herbaceous
Flowers White
Native Range: Calif Ore Wash
Synonomy: Vancouveria brevicula, Vancouveria parvifolia, Vancouveria picta; Epimedium hexandrum Hooker
Description: Leaves falling when fruits maturing, 2-3-ternately compound, 8-30 cm; petiole 3-25 cm, pilose at base. Leaflet blades narrowly to broadly ovate to rhomboid or rounded pentagonal, often 3-lobed, base cordate, margins entire to slightly sinuate and not conspicuously thickened, apex rounded to notched; surfaces abaxially sparsely hairy, adaxially glabrous. Inflorescences: peduncle 2-3 dm; pedicel 1-3 cm, glands absent. Flowers 5-30; bracteoles 6-9, white, yellowish when dried, dotted with glandular trichomes; sepals 6, white, 5-12 mm; petals 6, white, yellowish when dried, 4-6 mm, margins entire, petal apex strongly reflexed, with nectar-bearing pocket, nectaries golden; filaments stipitate-glandular. Follicles greenish to light brown, 10-15 mm including beak, beak 2-3 mm, stipitate-glandular. Seeds 1-6, black, lunate to reniform, 3 mm. 2 n = 12.

Flowering and fruiting spring-summer (May-Jul). Redwood and Douglas-fir forests, deep shade; 100-1700 m; Calif., Oreg., Wash.

Vancouveria planipetala Berberidaceae !

INFO
Common Name: redwood insideout flower
Perennial Herbaceous
Flowers white, sometimes lavender-tinged
Native Range: Ca+ Or
Synonomy: Vancouveria parviflora Greene

Description: Leaves persistent, 2(-3)-ternately compound, 10-30 cm; petiole 1-15 cm, sparsely hairy, becoming glabrous. Leaflet blades rounded-deltate to rounded-pentagonal, often broader than long, obscurely 3-lobed, base cordate, margins conspicuously thickened, crisped, apex minutely notched; surfaces abaxially glabrous or sparsely hairy, adaxially glabrous. Inflorescences: peduncle 1-2 dm; pedicel 1-3 cm, stipitate-glandular. Flowers 20-50; bracteoles 6-9, white to yellow, glands absent; sepals 6, white to yellow, oblanceolate, 4-5 mm, glands absent; petals 6, white, sometimes lavender-tinged, 3-4 mm, margins entire, apex notched, not reflexed, lateral lobes bearing nectaries, nectaries golden; filaments without glands. Follicles greenish brown, 4-7 mm including beak, beak 2 mm, glands absent. Seeds 1-2, black, lunate, 3-4 mm. 2 n = 24.

Flowering spring (May-Jun); fruiting spring-summer (Jun-Jul). Redwood forests, shaded areas; 50-1700 m; Calif., Oreg.

Taxon Family Spelling Checked

Vasconcellea cundinamarcensis Caricaceae !

INFO
Common Name: Mountain Papaya, papaya de altura, papaya de tierra fría, tapaculo, papayuela (Colombia), bonete, chamburo, toronche, siglo, chilhualcán, siglalón (Ecuador), chichuacacón, titi-ish; En: mountain papaw, mountain papaya; Fr: papaye de montagne.
Perennial Tree
Height: 10-30ft.
Native Range: Andes: High elevation Columbia & Ecuador
Synonomy: Carica pubescens Lenné & C. Koch . (NOT = Vasconcellea pubescens A. DC.
Prodromus Systematis Naturalis Regni Vegetabilis 15(1): 419. 1864.)
Description: Bright yellow fruit about the size of a solo papaya, but with strongly lobed longitudinal segments. Fruit flavor is tart, and sugar is often sprinkled on the fruit before eating.
Semi-lignose, ramified, height to 10 m, leaves lobed, typical hairy below, propagated by seeds; flowers hairy green-yellow, plants monoecious or dioecious, fruit 5-lobed, ovoid-oblong, yellowish green to orange at maturity, 6-15 x 3-8 cm; many seeds; pulp cream to yellow. Pulp used to prepare preserves and candies. Flavour: sour, aromatic, pleasant. Rich in papain.
Cultivation: Fast-growing, herbaceous "tree" very similar to the common papaya, but hardier- withstanding light frosts. Grows to 10-30ft. Culture and care is similar to the papaya.
Prefer a light, fertile, well-drained soil. Although not as fussy about cold, wet soils as the papaya, the plants perform best in moderately dry winter conditions. During the growing season they need regular applications of nitrogen fertilizers. Feed monthly and adjust to the plant's response. Composted chicken manure makes a good mulch. Like papayas, they do not tolerate salty water or soil. Male and female flowers are borne on either the same plant or different plants, although most plants are dioecious. One tree may produce up to 50-60 fruits per season. Naturally grows in a cool tropical-subtropical climate with annual temperatures between 50-75F. Enjoys lots of rainfall. During moist spells fungal diseases can affect the leaves, but this is seldom a problem in California. It is important to watch for signs of viral infection and discard plants showing signs. Other diseases include powdery mildew and Phytophthora root rot. The two major pests are two spotted mite, Tetranychus urticae and the strawberry

5/27/2004 Tony Morosco — Seeds recieved under the name "Hardy Papaya, Carica monticola" unable to verify name. Might be Vasconcellea pubescens, V. stipulata, or V. x heilbornii.

Vasconcellea stipulata Caricaceae !

INFO
Common Name: Chamburo, toronche, siglalón silvestre (Ecuador)
Perennial Shrub
Height: 30ft.
Flowers White Yellow Red
Native Range: Andes: Central and Southern Ecuador (Azuay, Loja) and Northern Peru (Cajamarca)
Synonomy: Carica stipulata Badillo
Description: Semi-lignose, ramified, height to 10 m, propagated by seeds; typical stipules that convert in spines after leaf fall, leaves lobed; flowers variable white, yellow to reddish, plants dioecious, fruit variable 10-lobed, specially when immature, ovoid-oblong to oblong, yellowish green to orange at maturity, 6-15 x 3-8 cm; many seeds; pulp cream to yellow. Pulp used to prepare preserves and candies. Flavour sour, aromatic, pleasant. Very rich in papain.

Record Notes: Dead in bed 53 & 57A during freeze of 1991

Veltheimia bracteata — Liliaceae !

INFO
Common Name: Forest Lily
Perennial Geophyte
Flowers Pink Feb, Mar, Apr, May
Native Range: South Africa: East Cape
Synonomy: Veltheimia viridifolia Jacq., Veltheimia viridifolia Jacq.
Description: Occurring naturally in the coastal forest at Natal - From late Winter to Spring, the densely held tubular flowers (Knifophia-like) rise on 1' stems above the shiny, undulating foliage. The blooms, pink in full sun & greenish-pink in less light, are held upright when in bud & are pendulous when open. Each flower head lasts about a month. The flowers are pollinated by birds.
Veltheimia bracteata, from the eastern part of South Africa, is almost evergreen, without leaves for a couple of months late summer into fall, but benefits from reduced watering in the summer and is best grown in light shade. It flowers in the spring.

image of © 2005 David W. Kruse-Pickler, SFBG1992

image of © 2005 David W. Kruse-Pickler, SFBG1992

South. Afr. : perennial-Geophyte- Ht up to 0.6 m. Alt: 5 - 610 m. Distribution: EC

Cultivation: The fleshy bulb grows just below the surface soil, preferring to remain undisturbed & will gradually increase by division of its bulbs. Veltheimia are best suited to USDA zones 9b - 11, Sunset zones 16 - 24. Pest resistant and hardy to 30 degrees F!
Sun, Low water, Perennial
Record Notes: Name checked with African Flowering Plants Database, 12/6/2007.

Taxon Family Spelling Checked

Veratrum viride var. eschscholzianum — Melanthiaceae !

INFO
Common Name: green false hellebore
Perennial Herbaceous
Flowers Green
Native Range: North America
Synonomy: V. eschscholtzii A. Gray, V. eschscholtzianum , V. eschscholtzii A. Gray var. incriminatum B. Boivin, V. viride Aiton ssp. eschscholtzii (A. Gray) A. Löve & D. Löve, V. viride Aiton var. eschscholtzii (A. Gray) Breitung
Description: From Flora of North America:
Stems nearly glabrous proximally to densely tomentose distally. Leaves 15–30 × 10–18 cm. Inflorescences with branches spreading to commonly drooping. Flowers erect; tepals deep green to yellowish green, 5–12 mm. 2n = 32.
Flowering summer–fall. Moist meadows, openings in coniferous forests; 0–2500 m; Alta., B.C., N.W.T., Yukon; Alaska, Calif., Idaho, Mont., Oreg., Wash.

Western Native Americans (Bella Colla, Cowlitz, Kwakiutl, Okanagan, Quinault, Salishan, Shuswap, and Thompson) used Veratrum viride var. eschscholzianum as an analgesic, antirheumatic, emetic, laxative, and poison, as well as a cold, blood, heart, orthopedic, and skin aid (D. E. Moerman 1986). Native Americans from northern British Columbia and the Yukon Territory consumed young plants as herbage (A. E. Porsild 1951; G. A. Mulligan and D. B. Munro 1987).

Record Notes: Originally received as Veratrum eschscholtzii, which is a synonym. Name checked in Flora of North America. Note that in Jepson Manual & TROPICOS, it is reduced to Veratrum viride, 7/15/2008.

Bed 34A - California Qty:2 Pl:1/14/2010 Ckd:8/25/2011 Mona Bourell & Terry Seefeld
E of stream, N side of bridge; #40 on bed inventory map..GIS E map: G9

Notes

7/15/2008 Mona Bourell — Originally received as Veratrum eschscholtzii, which is a synonym. Species yields poisonous substances of medicinal and insecticidal value.

Verbascum 'Letitia' — Scrophulariaceae !

INFO
Common Name:
Perennial Herbaceous
Height: 1ft.
Flowers Yellow Jul, Aug
Description: Small silver leaves and little spikes of glorious yellow flowers. Suitable for containers and raised beds or even with alpines and dwarf perennials etc. This is a sun-loving plant and is tolerant of dry soil in cultivation, but not of wet soil in winter. Given good drainage it is frost-tolerant.

LOCATION
Bed 5D - Rock Garden Circle & Entry Central Lawn Qty:3~ Pl:
Ckd:7/26/2012 Mona Bourell

Notes

9/28/2004 Tony Morosco — Plants discovered in bed 5D, no previous accession. Plant sign with plants was broken, but could discern that plant was a Verbascum in the Scrophulariaceae, and was a cultivar that ended in "...TIA". The cultivar 'Letitia' seemed like the appropriate match based on name and leaf appearance.

Verbascum bombyciferum Scrophulariaceae ?

INFO
Common Name: mullein
Perennial Herbaceous
Height: 5ft. Spread: 3-5ft.
Flowers Yellow
Native Range: Greece
Description: Native to the mountains of Greece, is extremely tough & drought tolerant. Lemon yellow, 2" blooms are held on amazing 2' across candelabra-like spikes densely covered in white fur, lasting for months. Cut back & more will appear! Spectacular, silvery, 3-5' wide foliage rosettes are covered in white down. Easy in well-drained, poor to average soil. Self-sows! To enjoy the leaves for themselves-pinch out flowering shoots for several years. Deer resistant!

Record Notes: Name checked with The Plant List on 4/16/2012 by Mona Bourell. found to be "unresolved":
Verbascum bombyciferum Boiss. Diagn. Pl. Orient. 4: 52 1844.

6/26/2007 Mona Bourell	Shrub to 6 meters tall; with clasping sessile leaves.

Verbesina turbacensis Asteraceae !

INFO
Common Name:
Perennial Shrub
Height: 8-10 [15]ft.
Flowers White Sept, Oct, Nov, Dec, Jan, Feb
Native Range: S Mexico - South America
Description: Naturally occurring in southern Mexico at elevations of about 3000-9000' in montane rain forest growing with firs, liquidambar, pines, podocarps and oaks. Upright shrub 8-10' tall.
In cultivation it has reached 15' with a cluster of large cane-like stems shooting straight up in a narrow vase-like shape. The stems are clothed with handsome leaves, coarsely toothed at their ends, often exceeding 12" in length. In fall and winter the stems are topped by large clusters of white flower heads.
Cultivation: While susceptible to complete dieback from temps below 20F, vigorous growth was produced from the base the following spring after freeze; and the plants were almost completely regenerated in a year. Oak root rot may damage the plant but it usually outgrows this pathogen.
Record Notes: Name checked with The Plant List on 11/19/2012 by Mona Bourell.

ACCESSION **SFBG# 1991-0121 DEACCESSIONED** Rec'd: 1/1/1984

Verticordia plumosa 'Pink Lace' Myrtaceae !

INFO Common Name:
Perennial Shrub
Height: 2ft.
Flowers Lavender-pink
Description: From San Marcos Growers 2012:
Verticordia plumosa 'Pink Lace' (Featherflower) - An evergreen dwarf rounded shrub to 18 to 24 inches tall with attractive bluish soft needle-like foliage. Lavender-pink, delicately fringed flowers in tight clusters. Light honey fragrance. Profuse bloom winter and spring.A 2003 UCSC Koala Blooms Introduction. We grew this plant from 2003 until 2008 - it may still be available from one of the other UCSC Koala Blooms partners, Rosendale Nursery, Suncrest Nursery, Monterey Bay Nursery and Native Sons Nursery.
Cultivation: Plant in a sunny location with good drainage and minimal fertilizer. Drought tolerant. Hardy to the mid 20's F°.
Record Notes: Name checked with The Plant List on 5/17/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Vestia foetida Solanaceae !

INFO
Common Name:
Perennial Shrub
Height: 6ft. Spread: 5ft.
Flowers Yellow
Native Range: Chile
Description: Vestia foetida (Ruiz & Pavon) Hoffsgg., syn. V. lycioides Willd. (Solanaceae) An evergreen shrub with yellow tubular flowers, native of Chile, growing in woodland, flowering in spring–summer. Erect shrub to 1.8m. Leaves 2–5cm long, elliptic to oblong, bright glossy green, unpleasantly scented when bruised. Flowers nodding, solitary or a few together in the upper leaf axils, 3cm long, tubular with 5 recurved triangular lobes. Min. -5°C
Cultivation: Frost hardy - Plant can withstand temperatures down to -5°C (23°F)
Will grow outside in milder locations - This could include plants which would survive happily in a greenhouse or conservatory if not in a mild location. If you have a sheltered spot in your garden then it may do well here. - in greenhouse use loam based compost, full light, shade from hottest sun
Record Notes: Name checked with TROPICOS. Some of our plants received as Vestia foetida Hoffmanns. which is a synonym, 8/19/2010

Viburnum aff. henryi — Adoxaceae X

INFO
Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs or small trees, evergreen or semievergreen, to 7 m tall. Bark light brown. Branchlets of current year purplish brown or green, glabrous; branchlets of previous year gray-brownish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds oblong, with 2 pairs of separate scales; scales yellow stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green or reddish, robust, 1-2 mm, glabrous; leaf blade purplish green when young, obovate-oblong to oblong or narrowly oblong, 5-10(-13) × 2-4 cm, subleathery, abaxially stellate-pubescent in axils of veins, and with pedate holes in axils of veins, adaxially glabrous and lustrous, midvein raised abaxially, lateral veins 5-7-jugate, pinnate, slightly arched, rarely branched, partly ending in teeth, raised abaxially, impressed adaxially, veinlets transverse, inconspicuous on both surfaces, not lobed, base cuneate to rounded, without glands, margin serrate above middle part, apex acute to acuminate. Flowers appearing after leaves; inflorescence paniculate, terminal, 4-9 × 5-8 cm; rays opposite, decussate; first node of inflorescence with 2 rays, lax, glabrous, without large sterile radiant flowers; peduncles 2-4 cm, slender; bracts and bracteoles late deciduous or persistent and conspicuous, leaflike, green-whitish, linear-lanceolate, glabrous. Flowers on rays of 2nd and 3rd orders, fragrant, sessile. Calyx reddish; tube tubular to obconical-tubular, ca. 2 mm, glabrous; lobes broadly triangular, ca. 1 mm, glabrous, apex obtuse. Corolla white, rotate, ca. 6 mm in diam., glabrous or subglabrous; tube ca. 1 mm; lobes spreading, ovate-orbicular, ca. 2 mm, apex rounded, margin entire. Stamens equaling or slightly exceeding corolla lobes, inserted at apex of corolla tube; filaments ca. 2 mm; anthers yellow-whitish, oblong, ca. 1 mm. Styles nearly as long as calyx lobes; stigmas capitate. Fruit initially turning red, maturing purple-blackish, ellipsoid, 8-9 × ca. 6 mm, base rounded, apex rounded, glabrous; pyrenes slightly compressed, ellipsoid, 7-8 × ca. 4 mm, with a deep ventral groove, apex rounded. Fl. Jun, fr. Aug-Sep. 2n = 48*.
Native Habitat: Dense forests, moist grassy slopes;

Viburnum carlesii

Adoxaceae !

INFO
Common Name: Koreanspice viburnum
Perennial Shrub
Height: 4-6ft. Spread: 4-6ft.
Flowers White, Pink Spring
Native Range: Korea
Synonomy: Solenolantana carlesii (Hemsl.) Nakai

Not Invasive
Description: A charming shrub of rather loose habit, with roundish leaves, silvery on the underside and greyish-green above from their coating of fine hairs. The flowers expand as rounded clusters of good size in the latter part of April, though the buds are formed early the previous autumn. They are pink in bud, opening white and retaining a flush on the outside; they are finely fragrant and last a long time.
Cultivation: Prefers well-drained, mildly acidic soil, full sun to partial shade. Flowers on new wood. Buy plants on their own rootstocks to avoid suckering.
Propagation: by cuttings.
Record Notes: Name checked with The Plant List on 12/19/2011 by Mona Bourell.

Viburnum davidii

Adoxaceae !

INFO
Common Name: David viburnum
Perennial Shrub
Height: 3-5ft. Spread: 4-6ft.
Flowers White
Native Range: China: Sichuan
Description: a compact little evergreen shrub that grows in a dome shaped mound just 3-5 ft (0.9-1.5 m) tall and maybe a little wider. All viburnums have opposite leaves; this ones are elliptic, 3-6 in (7.6-15.2 cm) long, 1 -2 in (2.5-5.1 cm) wide, and decorated with three very conspicuous, almost parallel veins. The leaves are dark glossy green above and paler beneath. The tiny flowers are white and arranged in cymes about 3 in (7.6 cm) across at the branch tips. The fruits are olive shaped bright metallic blue drupes that are about 1/4 in (0.6 cm) long. 'Femina' is a cultivar reported to be heavy fruiting and reliable.
David viburnum is native to the province of Sichuan in western China. It is a popular ornamental in Europe and the Pacific Northwest of the U.S.
Cultivation: Cross-pollination between two different clones is necessary for fruit set, and some nurseries offer "male" and "female" clones.
Light: David viburnum does best in light shade. Afternoon shade may be necessary in hot climates.
Moisture: David viburnum needs a reliable water supply.
Hardiness: USDA Zones 7 - 9. David viburnum does best is moderate climates - not too hot in summer and not too cold in winter. It performs best in Zone 8, will sometimes get winter-damaged in Zone 7, and will suffer in Zone 9 summers.
Propagation: David viburnum can be grown from seed sown in autumn and left outside all winter. Most viburnums, and this one is no exception, are dioecious, meaning that it takes two to tango. Fruits are produced only if two clones are present so that they can cross pollinate. David viburnum can be propagated vegetatively from semi-ripe tip shoots taken in summer, but plants produced this way will all be the same clone as the original.
Record Notes: Spelling checked in GRIN , TROPICOS, 2/9/2010.

Viburnum dilatatum

Adoxaceae !

INFO
Common Name:
Perennial Shrub
Native Range: China, Taiwan, Korea, Japan
Description: From Flora of China:
Shrubs, deciduous, to 5 m tall. Bark light brown. Branchlets of current year grayish brown, densely bristlelike hairy and stellate-pubescent; branchlets of previous year dark purple-brown, terete, sparsely hairy or subglabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, 3-5 mm, acute, with 2 pairs of separate scales; scales densely bristlelike hairy and stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, robust, (2-) 10-30 mm, stellate pubescent or simple hairs less than 1 mm; leaf blade green when young, broadly obovate, obovate, or broadly ovate, 3-10 (-13) × 2-7(-11) cm, papery, abaxially yellowish forklike pubescent and stellate-pubescent, usually with dispersed yellowish or nearly colorless transparent glandular dots, adaxially adpressed hairy, midvein raised abaxially, lateral veins 6-8-jugate, pinnate, straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base rounded to obtuse or slightly cordate, sometimes cuneate, with 1-3 circular glands on both sides of midvein near base, margin serrate, apex acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, at apices of short branchlets with a pair of leaves, 4-10 cm in diam.; rays whorled; first node of inflorescence with 5 rays, dense, densely bristlelike hairy and stellate-pubescent, without large sterile radiant flowers; peduncles 1-2(-4) cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, hairy. Flowers on rays of 3rd and 4th orders, fragrant, shortly pedicellate or sessile. Calyx green; tube narrowly tubular, ca. 1 mm, stellate-pubescent; lobes ovate, ca. 0.5 mm, ciliate, apex obtuse. Corolla white, rotate, 5-8 mm in diam., stellate-pubescent; tube ca. 1.5 mm; lobes spreading, orbicular-ovate, 1.5-2.5 mm, ca. as long as wide, apex rounded, margin entire. Stamens conspicuously exceeding corolla, inserted at base of corolla; filaments 4-6 mm; anthers yellow-whitish, broadly elliptic, small, ca. 1 mm. Styles exceeding calyx lobes; stigmas 3-lobed. Fruit maturing red, ellipsoid-ovoid, 6-8 × 4.5-6.5 mm, base rounded

Viburnum ellipticum — Adoxaceae !

INFO
Common Name: common viburnum
Perennial Shrub
Flowers White
Native Range: California
Synonomy: Viburnum ellipticum var. macrocarpum
Description: Plant slender, generally hairy and glandular
Leaf deciduous; petiole 6–12 mm; blade 2–6 cm, elliptic to round or cordate, coarsely dentate except at base, generally 3-veined from base
Inflorescence 1–3 cm, rounded or ± flat-topped, generally with oblanceolate bracts; peduncles 1.5–4 cm; rays generally 7
Flower 6–8 mm diam
Fruit 10–12 mm, elliptic in outline
Seed 5-grooved
Ecology: Chaparral, yellow-pine forest, generally on n-facing slopes
Elevation: 300–1400 m.
Bioregional distribution: Northwestern California, n&c Sierra Nevada Foothills, San Francisco Bay Area
Distribution outside California: to Washington

Taxon Family Spelling Checked

Viburnum japonicum Adoxaceae !

INFO
Common Name: Japanese viburnum
Perennial Shrub
Height: 5-8ft. Spread: 4-5ft.
Flowers White Spring
Native Range: Japan
Synonomy: basionym: Cornus japonica Thunb.
Description: Leaves are opposite and glossy with serrated margins and elliptical in shape. Up to 4" in length. Glabrous one of the most attractive viburnums.

Evergreen trees to 6 m tall. Branches green, later slightly purplish, glabrous; pith white. Buds oblong-lanceolate, 0.7–1.4 cm long, smooth, purplish, with 2 (rarely 3) pairs of scales; outer scales small, 2–7 mm long. Leaves rhombic-ovate or rhombic-obovate, or ovate, 5--15 cm long, 4–10 cm wide, apex acuminate or acute, base widely cuneate, margin coarsely dentate-serrate, coriaceous, glabrous, lustrous, upper surface smooth, lower surface pale green, densely and minutely glandular dotted, lateral veins 5–7 pairs, straight, elevated on lower surface; petiole 1–3.5 cm long, glabrous, glandular dotted, purplish, grooved. Flowers March to May, foetid. Inflorescences flat-topped corymbose, terminal, usually with 2 pairs of leaves, 5--15 cm wide, with 5 or 6 umbellate rays; peduncle 1–5 cm long, glabrous; bracts linear-lanceolate, 1–2 cm long; bracteoles small. Calyx 1.5–2 mm long, glabrous, minutely glandular dotted; lobes 5, triangular, 0.5 mm long. Corolla white, 5–8 mm wide, deeply 5-lobed to near base; lobes ovate or elliptic, 2–3 mm long, margin scabrous. Stamens 5, shorter than corolla lobes, inserted at base of corolla; filaments 1.5–2 mm long; anthers oblong, 0.9 mm long, ivory. Disc rounded, 1 mm tall, whitish. Ovary 1.5–2 mm long, stigma sessile, obscurely 3-lobed. Fruit October to December. Drupes red, obovate or ellipsoid, compressed, 7–9 mm long, 5.5–7 mm wide, 3 mm thick. Stone ellipsoid, 6.5–7 mm long, 5--5.5 mm wide, 2 mm thick, with 2 shallow grooves on dorsal and 3 on ventral side.
Cultivation: Hardy to zone 8 or 7b. Is a good hedge plant if kept pruned. Can get leaf spot pretty bad, so must be in full sun.

Taxon Family Spelling Checked

Viburnum luzonicum Adoxaceae !

INFO
Common Name:
Perennial Shrub/tree
Flowers White
Native Range: East Asia and Philippines
Description: Shrubs or small trees, deciduous, to 3 m tall. Bark light brown. Branchlets of current year yellow-brown stellate-pubescent; branchlets of previous year dark purple-brownish, terete, sparsely stellate-pubescent, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, with 2 pairs of separate scales; scales yellow-brown stellate-pubescent. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, usually 3-10 (-15) mm, yellow-brown stellate-pubescent; leaf blade yellowish green when young, ovate, elliptic-ovate, or ovate-lanceolate to oblong, sometimes subrhombic, 4-9 (-11) × 2-5 cm, papery to thickly papery, abaxially sparsely stellate-pubescent or forklike pubescent, adaxially with transparent glandular dots and forklike pubescent on midvein, midvein raised abaxially, lateral veins 5-9-jugate, pinnate, straight or slightly arched, rarely branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base broadly cuneate to subrounded, with 0-2 circular glands on both sides of midvein near base, margin serrate, ciliate, apex acuminate to acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, usually at apices of short lateral branchlets with a pair of leaves or terminal on branchlets, 3-5 cm in diam.; rays whorled; first node of inflorescence with 5 rays, dense, yellow-brown stellate-pubescent, or mixed with forklike or simple hairs, without large sterile radiant flowers; peduncle usually very short or nearly absent, very rarely to 1.5 cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, hairy. Flowers on rays of 3rd and 4th orders, not fragrant, sessile or shortly pedicellate. Calyx yellowish green; tube ovoid-orbicular, ca. 1 mm, yellow-brown stellate-pubescent; lobes ovate-lanceolate, ca. 0.5 mm, ciliate, apex obtuse. Corolla white, rotate, 4-5 mm in diam., outside stellate-pubescent; tube ca. 1.5 mm; lobes spreading, ovate, exceeding tube, apex rounded, margin entire. Stamens shorter or slightly longer than corolla, inserted at base of corolla; filaments ca. 2 mm; anthers yellow-whitish, broadly elliptic, ca. 0.8 mm

Viburnum mongolicum

Adoxaceae !

INFO

Common Name: Siberian viburnum, Mongolian arrowwood
Perennial Shrub
Flowers White Apr, May
Native Range: E. Asia - E. Siberia
Synonomy: Basionym: Lonicera mongolica Pall. ; Viburnum davuricum (Pall.)
Description: A decidious shrub growing to 2m. It is hardy to zone 5. It is in flower from April to June. The flowers are hermaphrodite (have both male and female organs) and are pollinated by Insects. The plant not is self-fertile.
Cultivation: The plant prefers light (sandy), medium (loamy) and heavy (clay) soils. The plant prefers acid, neutral and basic (alkaline) soils. It can grow in semi-shade (light woodland) or no shade. It requires moist soil.
Record Notes: Name checked in the Flora of China checklist, 5/6/2009.

Viburnum odoratissimum var. awabuki — Adoxaceae !

INFO
Common Name: Sweet Viburnum
Perennial Tree
Native Range: Japan
Synonomy: Viburnum awabuki
Description: Evergreen trees to 20 m tall. Branches green or reddish, glabrous. Buds oblong, 0.8–1.7 cm long, with 2 or 3 pairs of scales, outer scales smaller, with furfuraceous brown stellate hairs. Leaves elliptic to oblong, 7–20 cm long, 4–8 cm wide, apex rounded to obtuse, base cuneate to widely cuneate, margin nearly entire to obscurely undulate-crenate, upper surface dark green, lustrous, smooth, glabrous, lower surface pale green, minutely punctate, lateral veins 5–8 pairs; petiole 1–4.5 cm long, glabrous, often purplish. Flowers June to mid July. Inflorescences paniculate, terminal, usually with 2 pairs of leaves, 5–20 cm long, 8–20 cm wide; branches opposite or sub-umbellate, glabrous, but hairy at nodes; peduncle 4–10 cm long; bracts sometimes foliaceous, bracteoles lanceolate to ovate, acute, sparsely hairy, caducous. Calyx 1–1.5 mm long, glabrous, 5-lobed; lobes triangular or depressed. Corolla rotate-campanulate, 6–8 mm wide, white, slightly odoriferous; tube 3–4 mm long; lobes 5, ovate, 2–3 mm long, usually recurved. Stamens exserted, inserted at top of tube; filaments 2.5–3 mm long; anthers oblong, 1.5–2 mm long, ivory. Ovary 1–2 mm long, style 1–1.5 mm long, greenish, stigma obscurely 3-lobed. Fruit September to October. Drupes elliptic or ovate, not compressed, 7–9 mm long, 5.5–7 mm wide, juicy, turning red then black. Stone elliptic, 6–6.5 mm long, 3.5–4.5 mm wide, 3 mm thick, with one deep longitudinal groove on ventral side.

Viburnum opulus — Adoxaceae !

INFO
Common Name: guelder rose, European highbush cranberry, European cranberry bush

Perennial Shrub
Height: 8-15ft. Spread: 10-15ft.
Flowers White
Description: Shrubs, deciduous, to 6 m tall. Bark dark gray, thin or thick, corky or not. Branchlets of current year green-brownish, sometimes reddish, glabrous or pubescent, with conspicuously raised lenticels; branchlets of previous year yellowish or red-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, stipitate, 4-6 mm, with 2 pairs of connate scales, inner scales membranous, base connate into a tube; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules 2, persistent, subulate, 1-5 mm; petiole green or reddish, robust, 1-5 cm, glabrous or pubescent, with 2-4 or more discoid glands near apex; leaf blade green when young, orbicular-ovate to broadly ovate or obovate, 6-12 × 5-10 cm, papery, abaxially spreading hairy especially on veins and vein axils, adaxially almost glabrous, midvein raised abaxially, 3-palmatinerved, veins straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, usually 3-lobed, leaves at apices of branches sometimes undivided, base rounded, truncate, or shallowly cordate, without glands, middle lobe often largest, margin irregularly dentate, apices of lobes acute, lateral lobes present, sometimes slightly spreading toward outside. Leaves on upper part of branchlets often narrow and longer, elliptic to oblong-lanceolate and not divided, margin sparsely crenate or shallowly 3-lobed; lobes entire or subentire, lateral lobes short, middle lobes elongated. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 5 -12 cm in diam.; rays whorled; first node of inflorescence with 6-8 rays, dense, glabrous or with simple hairs, with 5-10 large sterile radiant flowers, or totally composed of large sterile flowers; peduncle robust, 2-5 cm, glabrous or pubescent; bracts and bracteoles deciduous, leaflike, green, lanceolate, glabrous or sparsely hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, very shortly pedicellate. Sterile

Taxon Family Spelling Checked

Viburnum opulus ssp. calvescens Adoxaceae !

INFO
Common Name:
Perennial Shrub
Flowers White
Native Range: Japan, Korea, Mongolia, Russia, China
Description: From FOC description of species:
Shrubs, deciduous, to 6 m tall. Bark dark gray, thin or thick, corky or not. Branchlets of current year green-brownish, sometimes reddish, glabrous or pubescent, with conspicuously raised lenticels; branchlets of previous year yellowish or red-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid, stipitate, 4–6 mm, with 2 pairs of connate scales, inner scales membranous, base connate into a tube; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules 2, persistent, subulate, 1–5 mm; petiole green or reddish, robust, 1–5 cm, glabrous or pubescent, with 2–4 or more discoid glands near apex; leaf blade green when young, orbicular-ovate to broadly ovate or obovate, 6–12 × 5–10 cm, papery, abaxially spreading hairy especially on veins and vein axils, adaxially almost glabrous, midvein raised abaxially, 3-palmatinerved, veins straight or slightly arched, branched, ending in teeth, conspicuously raised abaxially, impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, usually 3-lobed, leaves at apices of branches sometimes undivided, base rounded, truncate, or shallowly cordate, without glands, middle lobe often largest, margin irregularly dentate, apices of lobes acute, lateral lobes present, sometimes slightly spreading toward outside. Leaves on upper part of branchlets often narrow and longer, elliptic to oblong-lanceolate and not divided, margin sparsely crenate or shallowly 3-lobed; lobes entire or subentire, lateral lobes short, middle lobes elongated. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, 5-12 cm in diam.; rays whorled; first node of inflorescence with 6-8 rays, dense, glabrous or with simple hairs, with 5-10 large sterile radiant flowers, or totally composed of large sterile flowers; peduncle robust, 2-5 cm, glabrous or pubescent; bracts and bracteoles deciduous, leaflike, green, lanceolate, glabrous or sparsely hairy. Flowers on rays of 2nd and 3rd orders, not fragrant, very shortly pedicellate. Sterile flowers: calyx like fertile flowers, corolla white, 1.3-2.5 cm in diam., long pedicellate; lobes broadly obovate

Intended for use in: Zellerbach Garden

LOCATION

Bed 41J - Temperate Asia- near hitching area Qty:1 Pl:1/4/2005
Ckd:2/16/2010 David Kruse Pickler
East corner of bed at intersection of paved and foot path.

Notes

2/16/2010 David Kruse-Pickler — Erik Nagata ID'd this plant as a V. plicatum subsp. tomentosum cultivar. He is not sure if it is 'Kems Pink' or 'Roseace' ID when it blooms. 'Rosacea' is a cultivar with bronze young foliage and pink-tinted, all-sterile flowers in large heads. 'Kem's Pink' has pale-pink snowball flowers and dark-green leaves with magenta edges

1/4/2005 Geoff Smick — Bob F planted this out into 41J from the nursery, updated location record.

4/19/2004 Tony Morosco — Plant not actually planted in bed 53F as noted on 1/2/04, still sitting in 0V.

Taxon Family Spelling Checked

Viburnum propinquum Adoxaceae !

INFO

Common Name:
Perennial Shrub
Native Range: China
Description: Shrubs, evergreen, to 2 m tall. Bark gray-brownish. Branchlets of current year red-brownish, lustrous, with small prominent lenticels, glabrous; branchlets of previous year grayish, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds ovoid-oblong, with 1 pair of separate scales; scales reddish brown, glabrous, apex acute. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1-2 cm, glabrous; leaf blade purplish when young, ovate to ovate-lanceolate or elliptic to elliptic-oblong, or linear-lanceolate or oblanceolate, 3-9(-11) × 1-4.5 cm, leathery, abaxially sometimes stellate-pubescent in axils of veins, adaxially glabrous, midvein raised abaxially, triplinerved, veins reaching to middle of leaves or above, pinnate, arched, branched, anastomosing near margin, raised abaxially, impressed adaxially, veinlets transverse, conspicuous abaxially, inconspicuous adaxially, not lobed, base subrounded or cuneate, both sides slightly asymmetric, without glands, margin usually remotely serrate, apex acuminate or acute. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, terminal, (2-)4–7 cm in diam.; rays whorled; first node of inflorescence usually with 7 rays, lax, glabrous, without large sterile radiant flowers; peduncles 1.5-2.5(-4) cm, slender; bracts caducous, leaflike, green, linear to linear-lanceolate, glabrous; bracteoles scalelike. Flowers on rays of 3rd order, not fragrant; pedicels 1-2 mm, slender. Calyx greenish; tube obconical, ca. 0.6 mm, glabrous; lobes broadly triangular-ovate, very small, ca. 0.4 mm, glabrous, apex obtuse. Corolla greenish white, rotate, ca. 4 mm in diam., outside glabrous, inside with long hairs at base; tube ca. 1 mm; lobes spreading, broadly ovate, ca. 1 mm, nearly as long as tube, apex rounded, margin entire. Stamens usually slightly longer than corolla, inserted near base of corolla tube; filaments 2-3 mm; anthers yellow, subglobose, ca. 1 mm. Styles nearly as long as calyx lobes; stigmas subsessile. Fruit not turning red, maturing blue-blackish, lustrous, subglobose or ovoid, (3-)5-6 × (3-)3.5-4 mm, base rounded, apex acute, glabrous; pyrenes globose, ca. 4 × 3 mm, with 1 very small and shallow ventral groove or without groove

Taxon Family Spelling Checked

Viburnum sargentii Adoxaceae !

INFO

Common Name:
Perennial Shrub
Height: 12-15ft. Spread: 12-15ft.
Flowers White
Native Range: NE Asia
Description: Habit and Form
- a deciduous shrub
- multistemmed, upright form
- 12' to 15' tall
- equal spread
- coarse texture
- moderate growth rate

Summer Foliage
- opposite leaf arrangement
- simple, deciduous leaves
- lobed
- 2" to 5" long
- dark green leaf color
- pubescent underside

Flowers
- white flowers
- clustered in a flat-topped cyme
- 3" to 4" across
- clusters have both sterile and non-sterile flowers
- showy

Fruit
- red fruit
- 0.33" to 0.5' long
- matures in September
- persists

Bark
- tanish-brown stem color
- shiny

Cultivation: hardy to zone 4, and warmer parts of 3
- full sun to partial shade
- easily transplanted and established
- best growth on fertile, moist soils
- very soil adaptable
- soil pH is not critical
- occasional pruning to remove oldest stems may be helpful
- very tough and easy to grow

Viburnum setigerum

Adoxaceae !

INFO
Common Name: tea viburnum
Perennial Shrub
Height: 13ft.
Flowers White
Native Range: China, Taiwan
Description: Shrubs, deciduous, to 4 m tall. Bark light brown. Winter buds and leaves black, black-brown, or gray-black when dry. Branchlets of current year grayish yellow, glabrous; branchlets of previous year gray, gray-brown, or purple-brown, terete, glabrous, with dispersed, small, rounded lenticels. Winter buds oblong, usually less than 5 mm, to 1 cm at most, with 2 pairs of separate scales, outer ones 1/3-1/2 as long as inner ones; scales glabrous. Leaves always opposite, not clustered at apices of branchlets; stipules absent; petiole green, slender, 1-1.5(-2.5) cm, sparsely adpressed long hairy or subglabrous; leaf blade green when young, ovate-oblong to ovate-lanceolate, rarely ovate to elliptic-ovate, 7-12(-15) × 3-5.5 cm, papery, abaxially yellowish adpressed long hairy only on midvein and lateral veins, adaxially long hairy, glabrescent, midvein raised abaxially, lateral veins 6-8-jugate, pinnate, straight, rarely branched, ending in teeth, conspicuously raised abaxially, slightly impressed adaxially, veinlets transverse, slightly raised abaxially, impressed adaxially, not lobed, base rounded, with 1 or 2 circular glands on both sides of midvein near base, margin remotely serrate except at base, apex acuminate. Flowers appearing after leaves; inflorescence a compound umbel-like cyme, often nodding, terminal, 2.5-4(-5) cm in diam.; rays whorled; first node of inflorescence usually with 5 rays, dense, glabrous or sparsely adpressed long hairy, without large sterile radiant flowers; peduncles 1-2.5(-3.5) cm; bracts and bracteoles deciduous, leaflike, green, lanceolate, glabrous. Flowers on rays of 3rd order, not fragrant, shortly pedicellate or sessile. Calyx green; tube tubular, ca. 1.5 mm, glabrous; lobes ovate, ca. 1 mm, glabrous, apex obtuse. Corolla white, rotate, 4-6 mm in diam., glabrous; tube 1-2 mm; lobes spreading, ovate, ca. 2.5 mm, exceeding tube, apex rounded, margin entire. Stamens subequaling corolla, inserted at base of corolla; filaments ca. 3 mm; anthers yellow-whitish, globose, very small, less than 1 mm. Styles not exceeding calyx lobes; stigmas capitate. Fruit maturing red, ovoid, 9-11 mm, base rounded, apex rounded

Viburnum sieboldii

Adoxaceae !

INFO
Common Name: Siebold's arrowwood
Perennial Tree
Native Range: Japan
Description: Deciduous trees to 7 m tall. Branches green with simple and stellate hairs or glabrous when young, after dark brownish gray. Buds 0.5–2 cm long, with 2 pairs of scales; scales often connate; outer scales somewhat rugose, caducous. Leaves oblong, elliptic to obovate, rarely oblanceolate, 5–15 cm long, 2–9 cm wide, apex rounded to acute, base cuneate to rounded, margin obtusely or coarsely serrate, with odor of sesame when bruised, upper surface dark green, sparsely hairy or glabrous, lower surface usually hairy, lateral veins 6–12 pairs, nearly straight; petiole 0.5–2 cm long, hairy, grooved. Flowers late April to mid June. Inflorescences terminal, paniculate, depressed pyramidal, 4–7 cm long, 6–14 cm wide; peduncle erect, 1.5–5 cm long, with simple and stellate hairs; branches usually opposite, bracts and bracteoles narrowly ovate or lanceolate, 1–3 mm long, ciliate. Calyx cupuliform, 0.7–1 mm long, obscurely 5-lobed. Corolla rotate, 7–9 mm wide, white; tube short, 1.5 mm long; lobes 5, ovate, 2–3.2 mm long. Stamens 5, inserted at mouth of tube, filaments 3–4 mm long; anthers elliptic, 1.3–1.5 mm long, ivory. Ovary oblong, 2.5–3 mm long, glabrous; stigma sessile. Fruit late July to October. Drupes elliptic, 8–10 mm long, 5–7 mm wide, 2.5 mm thick, with 1 deep longitudinal groove on ventral side.

Viburnum urceolatum Adoxaceae !

INFO
Common Name:
Perennial Shrub
Native Range: Japan
Description: Deciduous shrubs to 3 m tall, procumbent near base. Branches brownish, densely stellate hairy when young. Buds naked, oblong, 4--8 mm long, minutely stellate hairy. Leaves ovate, 3.5--10 cm long, 2--8 cm wide, apex rounded to acute, base cordate to rounded, margin denticulate, both sides stellate hairy, lateral veins 4--6 pairs; petiole 0.5--1 cm long, minutely hairy. Flowers June to July. Inflorescences terminal, compound-umbellate with 5 rays, 3--6 cm wide; peduncle 1.5--7 cm long, sparsely hairy; rachis often reddish; bracteoles ovate to lanceolate, 0.8--2 mm long, persistent. Calyx lobes widely ovate, 1--1.2 mm long, usually ciliate. Corolla short tubular, pinkish, 10--16 mm wide, glabrous; tube 6--12 mm long, 2--3 mm wide; lobes 5, widely ovate, 1--1.8 mm long, wide spreading. Stamens exserted, inserted near middle of tube; lower part of filaments fused, free part 2--4 mm long; anthers oblong, 1.5--2 mm long, ivory. Ovary 2--4 mm long, glabrous; style 1--1.3 mm long, green, stigma sub-capitate, red. Fruit September to November. Drupes broadly ellipsoid, 7--9 mm long, 5--7 mm wide, compressed, black at maturity. Stone ellipsoid, 6--7 mm long, 4--5 mm wide, 2 mm thick, with 3 ventral and 2 dorsal shallow grooves, albumen solid.

Taxon Family Spelling Checked

Viburnum x burkwoodii 'Mohawk' Adoxaceae !

INFO
Common Name:
Perennial Shrub
Height: 5-7ft. Spread: 5-7ft.
Flowers Red, Pink, White , Oct, Mar
Not Invasive
Description: Mohawk is the most fragrant of all the Viburnums and is also the reddest in bud. Eye-catching currant-red buds hold for several weeks before opening to unleash their sweet clover scent and reveal their white interiors, thus greatly extending the spring display. But that's only the beginning of their show!

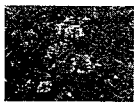

image of © 2005 Tony Morosco, SFBG1987-0071

Truly a three-season shrub, Mohawk follows its fragrant, colorful bloom season with bright red berries that attract songbirds to the garden. These in turn yield the spotlight to fall foliage, which turns rich, warm shades of orange and red when the weather grows cold. A stunning display!
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked with The Plant List on 9/27/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon Family Spelling Checked

Viburnum x carlcephalum — Adoxaceae !

INFO
Common Name: fragrant snowball
Flowers White
Parentage: V. carlesii x V. macrocephalum var. keteleeri.
Description: From MO Bot Garden:

Fragrant viburnum (also commonly called fragrant snowball) is an open, rounded, multi-stemmed, deciduous shrub which typically grows 6-10' tall and as wide. Features fragrant white flowers arranged in dense, snowball-like clusters (cymes 3-5" wide) in late April to early May. Blooms later than most viburnums. Flowers are followed by clusters of red berry-like drupes which ripen black. Fruit is not particularly showy. Ovate, grayish-green leaves (to 4" long) turn reddish-maroon in fall. This hybrid is a cross between V. carlesii and V. macrocephalum var. keteleeri.
Cultivation: Easily grown in average, medium, well-drained soil in full sun to part shade. Prefers moist loams, but tolerates a wide range of soils and has good drought tolerance. Prune as needed immediately after flowering, however pruning off spent flowers will eliminate summer fruit display, which admittedly is not very showy for this hybrid. For best cross-pollination and subsequent fruit display, plant shrubs in groups rather than as single specimens. This shrub is not reliably winter hardy in the St. Louis area where it should be planted in a protected location.
Record Notes: Name checked with The Plant List on 9/27/2014 by Mona Bourell.

Taxon | Family Spelling Checked

Viola betonicifolia — Violaceae !

INFO
Common Name: Australian long leafed violet
Perennial Herbaceous
Height: 0.5ft. Spread: 5ft.
Flowers White, Purple Year-round
Native Range: Eastern Australia
Description: Plants are often found in damp, shaded forest habitats, but they may also occur in more open sclerophyll forest or on grassy hillsides, growing well on cleared land not heavily grazed. Plants occur singly although clusters are more common. Individual plants have a tufted appearance growing from 5-40 cm high depending on local conditions. When found in an exposed situation, plants may die down to a perennial rootstock, particularly during a severe winter or drought. Viola betonicifolia will often set seed without obvious flowering, the plant producing some small, self-pollinating flowers that never open. This phenomenon is known as cleistogamy. Normal flowers are also produced. Plants flower prolifically, especially in spring. Flowers are usually 2 cm across and held singly above the foliage on slender stems. The colour may vary from pale purple to violet, fading with age. Leaves are 3-30 cm long, with a long petiole and a leaf blade resembling an arrow head.
Cultivation: Pests and diseases have not been observed although it is suspected that earwigs cause some damage by eating flowers. May die back in winter.
Propagation: by seeds or divisions

Orig. Qty: 1
Material: seed
Intended for use in: Conservatory: Highland Tropics

Wild Collected by Bian Tan & Glenn Keator 59; 20 September 1996 Malaysia: Pahang state, summit road to Gunung Brinchang. Montane forest at ca. 6,400ft. Under Ficus and Exbucklandia, with Dicranopteris, Dissochaeta, Lobelia. Viola curvistylis? Pale lavender flowers, velvety leaves, crenate/dentate, 1 inch long.. Flower color White

Notes

10/5/2006 Mona Bourell: Not found during inventory of 0L5 during inventory Sept 2006 by Jeanne & Mona. Last seen here 13 plants on 4/7/2005. Deaccession due to no other active locations, 12/19/2006.

4/7/2005 Tony Morosco: Found 13 what appear to be this accession in 0L5. Some marked with this accession number, some with no tags. PResume these are plants previously listed in 0G4 (15 plants in 1 gal last seen 10/19/04 by Geoff Smick). Tagged with "do not propagate, for CoF". Requesting Conservatory pick up ASAP.

11/30/2004 Geoff Smick: 1 dead plant in greenhouse. Updated qty. from 16 to 15.

8/31/2004 Tony Morosco: Found 18 4 inch pots of this taxon growing in bed 0G3, east side. Label indicated "Viola sp. Malaysia" and is a close match to know material of this accession. Added location for this plant. Also noted plant in 0L5 in one gallon pot.

5/20/2004 Tony Morosco: 1 dead bed 18C- Snail and slug predation. one remaining in lath house. again reccomend transferring to Conservatory one remaining plant.

1/8/2004 Tony Morosco: trailing stoliniferous plants.

9/30/2003 Tony Morosco: 1 Dead in bed 10A- Snail and slug predation. Reccomend transferring plants to Conservatory of Flowers.

Viola verecunda var. yakusimana Violaceae !

INFO

Common Name:
Perennial
Native Range: Japan
Description: Plants small, stems procumbent. Blade of leaves lustrous, cordate, less than 1 cm wide. Flowers 5–8 mm across. Petals 4–5 mm long.
For the species:
Glabrous; rhizomes short; stems ascending or decumbent, 5-20(-30) cm. long; radical leaf-blades reniform-cordate or deltoid-reniform, 1.5-2.5 cm. long, 2 -3.5 cm. wide, obtuse or deltoid-rounded, deeply open-cordate, obtusely undulate-toothed, the petioles 2 to 4 times as long as the blades; cauline leaves depressed-cordate, deltoid-cordate or deeply open-cordate, subacute to obtuse, the upper cauline leaves short; stipules membranous, green, lanceolate or linear-oblong, 7-20 mm. long, entire or with few obsolete teeth; peduncles cauline; flowers white; sepals broadly lanceolate, 4-5 mm. long, subacute, the appendage short, rounded, entire; petals 8-10 mm. long, the lateral ones slightly bearded inside at base, the lip shorter than the other petals, purple-striate, the spur short, saccate, 2-3 mm. long.

For the variety:
An extremely dwarf phase with leaves 3-7 mm. wide and petals 4-5 mm. long.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Taxon Family Spelling Checked

Vitex lucens Verbenaceae !

INFO
Common Name: Puriri
Perennial Tree
Flowers Red
Native Range: New Zealand- North Island
Description: A large and handsome tree which can grow to 18 metres in height. A very useful specimen tree but only in large gardens. It prefers a deep and rich soil and is intolerant of frost when young. The wood is one of N. Z.'s hardest and is ground durable for 25 years or more. The red flowers are attractive and can be present on the tree for 8 months of the year. The berry is a favourite food of the Wood Pigeon (kukupa).

image of © 2014 David Kruse-Pickler, SFBGXY-1301

An interesting point is that Puriri is self-fertile.A lone tree in the Melbourne Botanical Garden produces an abundance of fertile seed. The pollen that fertilises the stigmas is very sticky and is not freely shaken from the anther and is not in abundance at any one time. It is unlikely that Puriri depend upon birds for pollination. It is most likely that a large percentage of fertile seeds come from self pollination by the same flower or from a different flower from the same tree.This would suggest that their is not a lot of variety within the species, although I have heard of a white flowered type. [http://bushman.chips.cwa.co.nz/vitex_lucens.htm]

image of © 2014 David Kruse-Pickler, SFBGXY-1301

Propagation: Puriri is comparatively easy to raise from seed. Blackened mature drupes can be collected from beneath a suitable parent tree in Autumn, soaked for a week or so in water , then washed and scrubbed to remove the flesh. Alternatively, stones where the flesh has rotted away can also be collected. Sow the cleaned stones in a deep seed tray about 2 cm below the surface. Keep in a mild well watered situation. The best result I have had in germination came from removing the flesh from ripe berries picked from the tree. It wwas an easy job to remove the flesh and expose a clean stone. germination began in 2 weeks. Germination of a batch of stones should begin in 2 months and may continue for another 9 months or so.

Vitis coignetiae Vitaceae !

INFO
Common Name:
Perennial
Native Range: Japan
Description: Branches terete, smooth, brown-araneous when young. Leaves petiolate; blade cordate-orbicular, somewhat 5-angled, (8--)15--30 cm long and wide, base deeply cordate to shallowly cordate, margins with depressed-triangular, mucronate teeth, shallowly 3-lobed; median lobe depressed-triangular, apex acute to subacute, more or less sparingly arachnoid when young, densely reddish brown lanate on lower surface. Inflorescences to 20 cm long, including 3--6 cm long peduncle, about 8 cm wide, with tendrils. Flowers May to June. Fruits globose, ca. 8 mm across, purplish black when mature. Seeds ca. 5 mm long, broadly obovate, dark brown.
Record Notes: Spelling checked in GRIN database 12-17 -2005; further research needed on authors, native regions, common names, etc.

Common Name: Blood root, Rooikanol
Perennial Geophyte
Height: 5-7ft. Spread: 3-5ft.
Flowers Yellow Spring, May
Native Range: South Africa
Description: Wachendorfia thyrsiflora with its large golden flower spikes is very striking when in flower, and is a must for the marshy garden. It is a tall evergreen geophyte (perennial plant with underground buds). The rootstock is a branched, fleshy rhizome with clusters of thin adventitious roots at the nodes. The rhizome is a distinctive red colour, containing a red fluid rich in arylphenalenone pigments. The leaves are firm, hairless, entire and broadly sword shaped, with very distinctive longitudinally pleated leaf blades. The inflorescence is a dense cylindrical panicle of bright golden-yellow flowers on a tall sturdy stalk. Flowers are produced from spring until mid-summer (September - December). The leaves are from 0.6 to 1 m tall and the flower stalks can reach up to 2.5 m in height.
Cultivation: Wachendorfia thyrsiflora is an easy plant to grow and is ideally suited to marshy or swampy conditions in full sun or semi-shade, but will also grow in soil that is not waterlogged provided it gets ample water particularly during winter and spring. A generous mulch of compost is also very beneficial. It is evergreen if it is given water all year round, but if given total summer drought it may die down and go dormant, but it is best not to let it dry out during summer. Wachendorfia thyrsiflora is invaluable in difficult permanently wet areas, is an attractive addition to the water garden where it can be planted at the waters edge or where the water overflows, and it makes an excellent backdrop to the herbaceous border. It looks good mixed with Dietes bicolor, the yellow wild iris, and provides an interesting colour combination when mixed with the blue flower spikes of Aristea major. In a water garden or permanently wet area, it can be used with a variety of other plants also suited to this environment, like: Elegia capensis, Cyathea dregei (tree fern), Zantedeschia aethiopica (arum lily), Watsonia meriana, Cyperus papyrus (papyrus) etc. It multiplies rapidly and can be left undisturbed for several years without flowering being adversely affected. Wachendorfia thyrsiflora is not hardy to severe frost, but should be able to survive outdoors in USDA Zone 10 (-1oC / 30oF minimum)

Wahlenbergia matthewsii Campanulaceae !

INFO
Common Name: rock harebell
Perennial Shrub
Flowers Blue, White
Native Range: New Zealand
Description: Perennial, erect or spreading subshrub up ot 300 mm tall. Tap root fleshy, white, soon developing rhizomes. Stems arising from base, initally brownish-white, 2-3 mm diameter, soon purple-red to purple, glabrous, branching at the top into 2 or more almost naked scapes. Leaves crowded on stems, 10 x 1 to 50 x 3 mm, dark green, linear, glabrous, margins entire or distantly, finely toothed, sometimes recurved. Scapes 100-150 mm long, simple or branched again, bearing a few, distant, narrow linear bracts 5-15 mm long. Inflorescence, terminal, pedunculate. Calyx glabrous, 4 -5 x 1 mm, linear-triangular. Flowers pale blue to pale blue-lilac with white zoning and deeper blue or violet veins, or completely white; corolla 20-40 mm diameter, deeply campnaulate with tube 7 x 5 to 9 x 6 mm, lobes spreading, 10 x 6 - 20 x 8 mm, ovate-lanceolate. Anthers linear, 4 mm long, style equalling corolla tube, stigma usually 2-lobed. Capsule glabrous, 6 x 4 to 12 x 6 mm long, domed obconic. Seeds 0.5 mm long.
Confined to calcareous rocks, especially fine grained limestone. Coastal to montane (0 - 800 m a.s.l.), and mainly restricted to gorges and steep cliffs. Less commonly found growing in boulder falls and on sparsely vegetated terraces.
Flowering : December - April [New Zealand]
Cultivation: Natural habitat: Confined to calcareous rocks, especially fine grained limestone. Coastal to montane (0 - 800 m a.s.l.), and mainly restricted to gorges and steep cliffs. Less commonly found growing in boulder falls and on sparsely vegetated terraces.
Propagation: Easily grown from fresh seed. Does best in full sun, in a free draining, calcareous soil. Excellent in a rockery. A beautiful plant which deserves to be more widely cultivated than it is.
Record Notes: Originally in record mispelled as W. mathewsii. Name checked with IPNI and New Zealand Flora, 10/3/2007.

Wahlenbergia saxicola Campanulaceae !

INFO
Common Name:
Perennial Herbaceous
Native Range: Australia: Tasmania, New Zealand
Synonomy: synonym: Streleskia montana Hook.f.
Description: A beautiful species from the mountains of New Zealand, with leaves in close tufts and pretty flowers which first appear in June and keep coming in succession till November. It is easily raised from seed, and varies greatly from white to deep blue. Rock Garden plant in most areas.
Propagation: The best forms can be increased by division.

Wallichia oblongifolia — Arecaceae !

INFO
Common Name:
Perennial Palm
Native Range: Himalayas, China: Yunnan
Synonomy: Harina densiflora (Martius) Walpers; H. oblongifolia (Griffith) Griffith; Wallichia densiflora Martius
Description: Stems clustered, short and subterranean or to 1 m tall, to 40 cm in diam. Leaves spirally arranged; petioles to 2 m; rachis 1.5-2.5 m; pinnae 16 or 17 per side of rachis, ± oblong, with several lobes, regularly and alternately arranged, spreading in same plane, proximal 2 or 3 pinnae in a cluster, smallest erect; middle pinnae 45-56 × 7-12 cm, widest near apex. Inflorescences unisexual, male and female borne on separate stems; male inflorescences pendulous, not seen in their entirety; rachillae many, at least to 12 cm; male flowers 7-10 mm; stamens 6; female inflorescences to 1 m, horizontally spreading; rachillae 16-32, to 35 cm; female flowers to 6 mm. Fruits greenish brown to reddish, ovoid to ellipsoid, to 1.5 × 0.8 cm.
Lowland or montane rain forests, especially in rocky places on steep slopes; 200-1200 m. Yunnan [Bangladesh, Bhutan, India, Myanmar, Nepal].

The leaves are used for thatching and making brooms.

Record Notes: Originally in record as W. densiflora which is a synonym. Name checked with The Plant List and the Flora of China, 4/4/2011.

Weigela florida — Caprifoliaceae !

INFO
Common Name: oldfashioned weigela
Perennial Shrub
Height: 8ft. Spread: 4-6ft.
Flowers Pink Spring
Native Range: China+korea
Synonomy: Diervilla florida
Description: Of Shrubby habit, colonizing mainly by slowly creeping rootstocks. Vigorous, fast-growing and of long lifespan. Height: to 8', and to 4-6' wide. Native to NE China, Korea and Japan (Kyushu). Showy when in bloom, which is at a quiet time for shrubs.
Record Notes: Name checked with The Plant List on 9/27/2014 by Mona Bourell.

Weigela florida 'Alexandra' — Caprifoliaceae !

INFO
Common Name: wine & roses weigela
Perennial Shrub
Height: 4-5ft.
Flowers Reddish pink
Synonomy: Weigela florida 'Alexandra' WINE AND ROSES
Description: This weigela cultivar is a densely-rounded deciduous shrub which typically grows 4-5' tall with a slightly larger spread. It is primarily grown for its profuse reddish-pink spring flowers and its purple foliage. Reddish-pink, funnel-shaped flowers (to 1.25" long) appear singly or in clusters along the branches of the previous year's growth in mid to late spring, with sparse and scattered repeat bloom often occurring on new growth as the summer progresses. Elliptic to obovate, glossy, burgundy-purple leaves (to 4" long) turn very dark purple in autumn. Hummingbirds are attracted to the flowers. Patented under the original cultivar name of 'Alexandra' (PP10,772), but is being marketed under the registered trademark name of WINE AND ROSES. Winner of the Pennsylvania Horticulture Society Gold Medal Plant Award for 2000.

Cultivation: Sun, reg water, rich soil
Record Notes: Name checked with Missouri Botanical Garden Kempfer Center, 10/21/2009.

Taxon Family Spelling Checked

Westringia 'Wynyabbie Gem' Lamiaceae !

INFO
Common Name:
Perennial Shrub
Height: 4ft.
Flowers White, Purple Feb
Parentage: Westringia fruticosa x Westringia eremicola (mauve flowered form)
Description: A hybrid of W. eremicola x fruticosa. Compact shrub to 4' tall and wide, with typical narrow, silky grey green leaves. Light mauve purple flowers are produced throughout the year. This shrub gives a nice touch to landscapes or gardens with its lavender flowers against grey foliage. Grows quickly, but retains its wispy character. From UC Santa Cruz.

From San Marcos Growers:

Westringia 'Wynyabbie Gem' (Wynyabbie Coast Rosemary) - This hybrid between the coastal Westringia fruticosa and the inland growing Westringia eremicola is a fast growing upright dense-growing shrub that can reach 6-8 feet tall by 6 feet wide with slender gray-green (white beneath) 1 inch long leaves that radiate out from the dark stems in evenly spaced whorls. The clusters of attractive mauve-pink flowers are produced throughout the year. Plant in full sun to light shade. It is drought and seaside tolerant, and will take cold down to at least 25 degrees F and likely a bit lower. This plant has proven useful as a large specimen shrub or as a sheared hedge, though we have had reports that regular shearing may shorten the lifespan of this plant and 8 to 10 years may be all one can expect it to live with this treatment; with its interesting foliage and rapid growth this may still be acceptable to some. We received Westringia 'Wynyabbie Gem' from the late Gary Hammer in 1991 and have been growing it at San Marcos Growers since 1992. It originated in cultivation at Wynyabbie Nursery in Jindalee, Queensland from where it gets its cultivar name. The name for the genus was given to it by Sir James Edward Smith, an English botanist and founder of the Linnaean Society in 1788 to name honor Dr. Johan Peter Westring (1753-1833), a botanist and physician to King Charles XIII of Sweden who was a student of Linnaeus. We also grow a new selection of Westringia called Westringia Blue Gem that is similar but denser and tolerates trimming better as well as a variegated selection of 'Wynyabbie Gem'

Taxon Family Spelling Checked

Westringia fruticosa Lamiaceae !

INFO
Common Name: Coastal Rosemary
Perennial Shrub
Height: 5ft. Spread: 10ft.
Flowers White Mar, Apr
Native Range: Southeastern Australia
Synonomy: synonym: Westringia rosmariniformis Sm.
Description: This is the one westringia well-known in California—though not necessarily under its new name. It is a dense, spreading shrub, up to 5' high and 8-10' broad. The twigs are crowded with narrow, pointed leaves, silvery on both surfaces in the most popular form. It blooms most heavily in spring but has at least a sprinkling of its small white flowers much of the year. Two interesting, more recent selections are 'Wynyabbie Gem', with pale lavender flowers, and 'Morning Light', a smaller plant with cream-margined leaves.
Cultivation: Sun, reasonably well drained soil, little watering when established. Hardy to 20oF or less.

Weigela florida 'Bristol Ruby' Caprifoliaceae !

INFO
Common Name:
Perennial Shrub
Flowers Red
Cultivation: Prefers full sun but will tolerate some light shade. Attracts butterflies and hummingbirds. Provides a beautiful cut flower for your bouquet.

Will handle pruning if done immediately after blooms fade. This will maintain good shape and encourage reblooming. Lovely as a hedge or border, or as a beautiful exhibit of color in your spring landscape. Give it adequate space, Weigela dislikes crowding
Record Notes: Name checked with The Plant List on 9/27/2014 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Weigela florida 'Minuet' Caprifoliaceae !

INFO
Common Name:
Perennial Shrub
Height: 3ft. Spread: 3-4ft.
Flowers Purple-red with yellow
Description: 'Minuet' is a dense, rounded, deciduous weigela that is noted for its dwarf size, purple tinged foliage and purplish red flowers with yellow throats. It typically grows to only 3' tall and spreads to 3-4' wide. The funnel-shaped flowers bloom profusely in spring, with a sparse and scattered repeat bloom sometimes occurring in mid to late summer. Flowers are slightly fragrant. Purple-tinged, elliptic to obovate leaves retain good color throughout the growing season. Insignificant fall color.

Cultivation: Easily grown in average, medium moisture, well-drained soils in full sun. Needs full sun for best flowering and foliage color, but will tolerate very light or sun dappled shade. Prune to shape if needed immediately after flowering.

Record Notes: Cultivar name found used in the trade with internet search, 4/18/2011.

Weigela subsessilis Caprifoliaceae !

INFO
Common Name:
Perennial Shrub
Height: 4-6ft. Spread: 3ft.
Flowers pale yellowish-green to lavender May, Jun, Jul
Native Range: Korea
Description: Shrubs multiple-stemmed from the base to about five feet in height with a spread of about three feet. Compact and twiggy, these individuals have been free of disease and insect pests. Moreover, they have proven to flower generously each spring, and the gradual color changes in the flowers make these plants intriguing ornamentals m the spring landscape. The flowers are produced on new growth from second-year wood as the leaves are ex-
panding. Each inflorescence consists of clusters of three or four, even up to six flowers.
When fully open, the flowers measure between 2.5 and 3.5 cm in length. As the flower buds
enlarge, they assume a yellowish-green color that gradually changes through various shades of pink to a pale lavender when the flowers are in full bloom. Since inflorescences are profuse and individual flowers represent different stages of maturation, the overall effect of the shrub is a unique combination of pastel colors from pale yellowish-green to lavender.

Westringia fruticosa 'Morning Light' Lamiaceae !

INFO
Common Name: Coastal Rosemary
Perennial Shrub
Height: 5ft. Spread: 10ft.
Flowers White
Native Range: Southeastern Australia
Description: This is the one westringia well-known in California—though not necessarily under its new name. It is a dense, spreading shrub, up to 5' high and 8-10' broad. The twigs are crowded with narrow, pointed leaves, silvery on both surfaces in the most popular form. It blooms most heavily in spring but has at least a sprinkling of its small white flowers much of the year. Two interesting, more recent selections are 'Wynyabbie Gem', with pale lavender flowers, and 'Morning Light', a smaller plant with cream-margined leaves.
Cultivation: Sun, reasonably well drained soil, little watering when established. Hardy to 20oF or less.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.

Westringia rosmariniformis Lamiaceae !

INFO
Common Name: coast rosemary
Perennial Shrub
Height: 4-6ft. Spread: 8-10ft.
Flowers White
Native Range: Australia Se.
Synonomy: Westringia fruticosa (Willd.) Druce
Description: From San Marcos Growers: Westringia fruticosa (Coast Rosemary) - This dense evergreen shrub that in cultivation here in California typically grows to be a 4-6 feet tall mound and nearly twice as wide and can be left as a dense rounded shrub or be sheared for a more formal look. The linear dark gray-green leaves look similar to rosemary foliage, explaining one of the synonyms for this plant, Westringia rosmariniformis. The small white flowers bloom along the branches year-round in mild climates (spring-bloomer in colder areas). We have been growing this great shrub since 1984 and it has proven itself to be useful, fairly drought tolerant and long lived in the landscape. It is native to the coast of New South Wales where it can be seen hugging the cliffs and growing near the sand on the beach. The name for the genus was given to it by Sir James Edward Smith, an English botanist and founder of the Linnaean Society in 1788. The name honors Dr. Johan Peter Westring (1753-1833), a botanist and physician to King Charles XIII of Sweden who was a student of Linnaeus. The specific epithet comes from the Latin word 'frutico' meaning "to put forth shoots" or "become bushy", likely in reference to the dense bushiness of this species. We also grow several cultivars of this species including the variegated forms Westringia fruticosa 'Morning Light' and Westringia fruticosa 'Smokey' and the low growing Westringia fruticosa Mundi as well as the hybrids Westringia 'Wynyabbie Gem' and Westringia 'Wynyabbie Highlight'.
Cultivation: Plant in full sun where it is drought tolerant but keeps better color and remains more dense when given occasional spring and summer irrigation. Hardy to about 20° F. It is an excellent densely growing shrub for coastal plantings where it can tolerate wind and sea spray.
Record Notes: Name checked with Tropicos List on 7/2/2013 by Mona Bourell.

Whipplea modesta — Hydrangeaceae !

image of 1974 John Kipping

INFO
Common Name: common whipplea
Perennial Shrub
Flowers White
Native Range: Calif - Wash
Description: Subshrub
Stems: main prostrate, lateral and terminal decumbent to erect; bark gray-brown, peeling as narrow strips
Leaves persistent, ± sessile; blade 1.5–4 cm, 1–3 cm wide, ovate to elliptic, coarsely strigose, upper surface hairs ascending, bulbous-based
Inflorescence: cyme or raceme, dense; flowers 4–12
Flower 4–6 mm wide, odorless; sepals 4–6, 1.5–2 mm, narrowly oblong, ± glabrous; petals 4–6, 3–6 mm, obovate, white; stamens 8–12, ± equal, filament base wide, flat; ovary half-inferior, chambers 4–5, incomplete, placentas ± axile, ovule 1 per chamber, styles 4–5, stigma terminal
Fruit depressed-spheric, separating into segments
Seeds 1 per chamber, plump, honeycomb-pitted
Ecology: Slopes, coniferous forest
Elevation: < 1400 m.
Bioregional distribution: Northwestern California, w San Francisco Bay Area (Santa Cruz Mtns), n Outer South Coast Ranges
Distribution outside California: to Washington
Cultivation: Information from the Jepson Horticultural Database for Whipplea modesta:
Given excellent drainage (modification of compacted or other water-holding soils may be necessary), grows especially well in zones 4, 5, and 6.
Given excellent drainage (modification of compacted or other water-holding soils may be necessary), moderate summer watering, and full or part shade (morning and winter sun may be tolerated), grows especially well in zones 15, 16, and 17 and also in zones 7 and 14.

Good groundcover.

Taxon Family Spelling Checked

Widdringtonia cedarbergensis Cupressaceae !

INFO

Common Name: Cape cedar, Clanwilliam cedar (Eng.); Clanwilliamseder, sederboom (Afr.)
Perennial Tree
Height: 25-30ft.
Native Range: South Africa: Cederberg Mountains
Synonymy: Widdringtonia juniperoides Endl.
Description: The Clanwilliam cedar is confined to an approximately 250 km2 area in the Cederberg Mountains, about 240 km north of Cape Town. They are critically endangered and are on the brink of extinction after decades of unsustainable harvesting for their beautiful, long-lasting, fragrant timber, and from too frequent veld fires.

They occur singly or in scattered groups on rocky outcrops and mountain tops at altitudes from 800 to 1 980 m. In former times the whole mountain chain was studded with these trees, but by 1883 nearly all accessible trees of commercial value had been felled. The Clanwilliam cedars today are usually 5-7 m tall, but in protected, inaccessible places, specimens of up to 20 m with a trunk of up to 2 m. in diameter can be found - although many of them were killed in the fire of 1989. But even these large specimens are dwarfs compared to the past giants that must have been at least double the girth of any of those now standing. There is a report of a tree cut down in 1836 having a girth of 36 feet (11 m).

Young trees have a conical crown, old trees have massive gnarled trunks and spreading branches. The bark is reddish grey, thin and fibrous, flaking in scale-like plates. Juvenile leaves are narrow and needle-like, 20 x 2 mm and are spirally arranged. Adult leaves are small, scale-like, up to 4 mm long, and lie flat along the branches in pairs. Both forms are sometimes present on a young tree.

Widdringtonias are not so easy to identify in the Garden, but possible: W. nodiflora female cones are smooth, wrinkled or slightly warty, whereas the other two are conspicuously rough and warty. W. schwarzii seed has a conspicuous wing, whereas that of W. cedarbergensis is smaller. W. nodiflora is a variable species that extends into tropical Africa. The Mlanje cedar of Malawi, W. whytei is considered to be a variant of W. nodiflora

10/17/2006 Mona Bourell — Jeanne found 4 in 0B3 during inventory, 10/17/2006.

Widdringtonia nodiflora Cupressaceae !

INFO

Common Name: Mountain Cedar, mountain cypress, bergsipres, berg cypress, sapree-wood
Perennial Tree
Height: 18ft.
Native Range: Southern Africa: South Africa, Mozambique, Zimbabwe
Description: Shrub or small tree to 6 m tall, but in a few remote areas in the mountains of eastern Zimbabwe much larger specimens are occasionally found. Bark is brown to gray, thinly fissured vertically and flaking in long, narrow strips revealing a reddish underbark. The juvenile leaves are needle-like, green, spirally arranged, up to 2 cm long. Adult leaves are scale-like, about 2 mm long, dark green. Pollen cones are terminal, 2-4 mm long. Seed cones are globose, dark brown, 15-20 mm diameter. Cone scales 4, woody, with a wrinkled surface and a few protuberances. The seed cones mature around March, but cones in varying stages of development may be found throughout the year. The seeds are dark brown to black, with a conspicuous red wing (Palgrave 2002).
The timber is very durable and makes tough roofing shingles that weather to an attractive silver-grey. The wood has a natural satiny sheen, and is suitable for furniture and finish carpentry (Palgrave 2002).
Record Notes: Name checked with The Plant List on 7/9/2014 by Mona Bourell.

Taxon Family Spelling Checked

Widdringtonia schwarzii Cupressaceae !

INFO
Common Name:
Perennial Tree
Height: 60ft.
Native Range: South Africa
Synonomy: Callitris Schwarzii
Description: Widdringtonia schwarzii is much larger than its cousin W. cedarbergensis, and grows to a height of 17–20 m on average. The bark is red-grey, thin and fibrous; leaves are flattened, ovate, grey-blue, and darker than those of W. nodiflora, the mountain cypress. Juvenile leaves are narrow and needle-like and are spirally arranged. Fruits are in the form of cones, with male and female cones borne on the same plant. Male cones are very small, up to 2 mm long and are produced in autumn.
Female cones are dark brown, with rough, warty scales. They develop in autumn and remain on the tree for almost three years before the seeds are released during late summer. As a result, cones can be found in various stages of development on the tree, all year round. Seeds are black-brown, ovoid and broadly winged.

Propagation: Treat the seeds of Widdringtonia schwarzii with Instant Smoke Plus Seed Primer to aid with germination. Seeds should be sown in autumn when the night time temperatures have dropped to 15ºC. Sow the seeds 1 mm deep in a peaty seed sowing mix, germination will take approximately 30 days. Once germinated, seedlings should be transplanted into larger containers and are best grown on in semi-shade. Widdringtonias are susceptible to the root fungus Phytophthora cinnamomi, thus sterile, well-drained sandy soil is recommended when potting up.
Record Notes: Name checked with The Plant List on 7/9/2014 by Mona Bourell.

Wigandia caracasana Hydrophyllaceae !

INFO
Common Name:
Perennial Tree
Flowers Purple Jun, Jul
Native Range: Mexico
Synonomy: Wigandia urens (Ruiz & Pav.) Kunth var. caracasana (Kunth) D. Gibson
Description: The principal dermatitic constituents of W. caracasana were isolated from the glandular hairs and identified as unusual prenylated quinones and prenylated phenols. Potentials to elicit irritant and allergic contact dermatitis .
Cultivation: They prefer full sun and rich, porous soil kept constantly moist. Keep winter temperatures above 45º to 50º F. Cut back to shape and control in early spring. Handle with gloves, as the leaves' lustrous hairs can irritate skin.
Propagation: In cold climates, raise seeds in indoor pots in late winter. After the last frost, harden in a cooler shelter for a week or two before transplanting outdoors, 5 feet apart. Can also root cuttings of new spring growth.
Record Notes: Name checked in ITIS. ITIS Database notes TSN=31625 useage as 'accepted'. 2004-07-19.

Wikstroemia scytophylla

Thymelaeaceae !

INFO

Common Name:
Perennial Shrub
Height: 9ft.
Flowers Yellow Jun, Jul, Aug, Sept, Oct, Nov
Native Range: Tibet, China
Synonomy: Daphne scytophylla
Description: Shrubs evergreen, 0.5-3 m tall, densely branched. Branches pale yellowish green, turning purplish or grayish brown, nearly 4-angled, glabrous. Upper leaves usually opposite; petiole short, ca. 1 mm, glabrous; leaf blade whitish green abaxially, oblanceolate to oblong, 2-4 × 0.3-1.2 cm, leathery, both surfaces glabrous, base cuneate to broadly cuneate, apex apiculate; lateral veins at narrow angle to midrib, obscure abaxially, conspicuous adaxially. Inflorescences terminal or axillary, racemose, solitary, usually pendulous at anthesis; peduncle 2-4 cm, rachis elongated during anthesis, slightly thickened and succulent, stouter and stronger than peduncle, glabrous; rachis conspicuously scarred after fruit shed. Pedicel ca. 1 mm, articulate, glabrous. Calyx yellow; tube narrowly cylindric-trumpet-shaped, ca. 10 × 1 mm, exterior glabrous; lobes 5, ovate, ca. 1 mm, margin undulate, apex obtuse. Stamens 10, lower whorl inserted above middle of calyx tube, upper whorl in throat; filaments short; anthers oblong, 1-1.2 mm, included within calyx tube. Disk scale 1, oblong-ovate, ca. 0.5 mm. Ovary fusiform, ca. 4 mm, sparsely sericeous-pubescent; style short; stigma capitate. Drupe brownish purple, ovoid, ca. 5 mm, base narrowed, enclosed by persistent calyx. Fl. between summer and autumn, fr. winter.
Native habitat: Dry shrubby slopes, on limestone; 1900 -3000 m. Sichuan, Xizang, Yunnan.

Record Notes: Name checked with IPNI, 10/18/2007.

Wisteria floribunda 'Macrobotrys' Fabaceae !

INFO
Common Name:
Perennial Vine/Liana
Flowers Lilac blue
Synonomy: Wisteria floribunda f. macrobotrys
Description: Japanese Wisteria Macrobotrys is a hardy twining climber which grows slowly at first and eventually reaches to 8 - 10m with a spread of 6 - 8m, but it can be kept smaller with frequent pruning. Japanese floribunda Macrobotrys produces long trails of fragrant, lilac blue flowers, up to 80cm, through summer. Very popular for training along wires on a wall or fence but also suitable for a trellis or rambling through trees.

Name: Wisteria floribunda 'Macrobotrys'
Growth Habit: vigorous vine
Flower Color: purple/mauve/white
Flower Type: 24-36 inch racemes
Leaf Color: dark green
Leaf Desc: pinnate, composed of leaflets
Time: spring

Cultivation: Sun or part shade & well drained fertile soil. Wisteria should be lightly pruned each year in January and July to produce short spurs, this greatly encourages flowering

USDA Zone: 5-9
Exposure: filtered to full sun
Growing Conditions: humus-rich, moist, well-drained soil

Wisteria sinensis Fabaceae !

INFO
Common Name: Chinese wisteria
Perennial Vine/Liana
Flowers Purple
Native Range: China, Japan
Synonomy: Glycine sinensis Sims, Bot. Mag. 46: t. 2083. 1819; Wis-teria alba Lindley; W. praecox Handel-Mazzetti; W. sinensis f. alba (Lindley) Rehder & E. H. Wilson; W. sinensis var. albi-flora Lemaire.

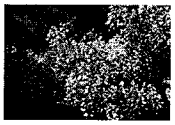

image of 1979 G. Courtwright

Description: Lianas, to 25 m. Stems twined leftward, white villous when young, soon glabrescent. Leaves 7-13-foliolate; rachis 15-25 cm, including petiole 3-5 cm; leaflet blades elliptic-ovate to lanceolate-ovate, 5-8 × 2-4 cm with basal pair smallest and becoming larger apically, both surfaces appressed pubescent when young but glabrescent, base rounded to cuneate and some-what asymmetric, apex attenuate to caudate. Racemes terminal or axillary from branchlets of previous year, 15-30 × 8-10 cm, white villous. Pedicel 2-3 cm, slender. Flowers 2-2.5 cm, fra-grant. Calyx with adaxial tooth longer than others. Corolla pur-ple or occasionally white; standard orbicular, sometimes retuse, glabrous, apex truncate. Ovary tomentose, with 6-8 ovules. Leg-ume oblanceolate, 10-15 × 1.5-2 cm, tomentose, hanging on branches persistently. Seeds 1-3 per legume, brown, thickly len-ticular, ca. 1.5 cm in diam., shiny. Fl. Apr-May, fr. May-Aug. 2n = 16.
Native habitat:
Mountain forests; 500-1800 m. Anhui, Fujian, NE Guangxi, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shaanxi, Shandong, S Shanxi, Zhejiang [Japan].

This species is cultivated extensively in areas beyond its native range.

Wisteria sinensis 'Cooke's Purple' Fabaceae !

INFO
Common Name: Chinese wisteria
Perennial Vine/Liana
Height: 30+ft. Spread: 30+ft.
Flowers Purple early spring, sporatic in summer
Native Range: China
Synonomy: Wisteria sinensis 'Cooke's Special'™
Description: Impressive spring show of large, beautiful purple blossoms. Long racemes of fragrant flowers cover the vine in early spring. This selection also gives smaller spikes of purple blooms during the summer months. Blooms best in full sun. Drought tolerant. Can be grown as a vine or trained upright into a standard.

Wisteria sinensis 'Kofuji' Fabaceae !

INFO
Common Name: dwarf wisteria
Perennial Vine/Liana
Height: 2-3ft. Spread: 2-3ft.
Flowers Lavender
Description: A wisteria that won't devour the neighbor's garage. This one is petite in all respects, growing slowly to form a dense shrub, to 3' tall and wide, of twiggy branches with tiny leaves. In spring, the sweetly scented, lavender flowers appear before the small, deep green leaves. Often 2 or 3' tall and wide, though an occasional flowering stem is taller
Cultivation: Full to part sun in moist, well-drained soil with summer water. Frost hardy in USDA zone 5.
Record Notes: Name checked with The Plant List on 7/16/2012 by Mona Bourell. Cultivar name found used in the trade with Internet search.

Taxon | Family Spelling Checked

Wollemia nobilis — Araucariaceae !

INFO
Common Name: Wollemi Pine
Perennial Tree
Height: 50-125ft.
Native Range: Australia: Eastern New South Wales
Not Invasive

image of © 2004 SFBG2004 -1061N

Description: Wollemia nobilis is an evergreen tree reaching 80-112 feet tall. The bark is very distinctive, dark brown and knobbly, quoted as resembling bubbling chocolate. The tree coppices readily, and most specimens are multi-trunked or appear as clumps of trunks thought to derive from old coppice growth. The branching is unique in that nearly all the side branches never have further branching. After a few years, each branch either terminates in a cone (either male or female) or ceases growth. After this, or when the cone becomes mature, the branch dies. New branches then arise from dormant buds on the main trunk. Rarely, a side branch will turn erect and develop into a secondary trunk, which then bears a new set of side branches.

The Wollemi has two types (or phases) of leaves. It does not have needles like pine trees in the northern hemisphere. Its young broad-based juvenile leaves are bright lime-green and grow in low light under the rainforest canopy. The adult leaves, which grow in much harsher conditions above the canopy, are tougher and a deeper bluish-green.The leaves at the beginning and end of a growing season are shorter than those formed during the middle of the season, creating a diamond shaped pattern along the branch. The leaves also have an in-built system to help reduce water loss.

There are two types of branches on the Wollemi Pine:
1 - one grows upright (orthotropic), forming a stem or another trunk, depending where it starts
2 - the other grows sideways (plagotropic) from an upright branch and the leaves develop on these branches. Unlike trees in the genus Araucaria, the sideways branches do not divide unless the growing tip (apical meristem) is damaged.

Upright branches start from buds borne along the trunk, eventually maturing with foliage and a branching structure resembling the initial trunk, so that older trees develop a branched crown. Upright branches that develop from buds at the base of the trunk, referred to

Woodwardia fimbriata

Blechnaceae !

INFO

Common Name: giant chainfern
Perennial Fern/Pteridophyte
Height: 3-6ft. Spread: 6-12ft.
Native Range: B.C. to California
Synonomy: Woodwardia chamissoi
Description: Rosette forming, deciduous fern. Fronds can get as tall as 6 feet, although some of the largest ferns have reached heights of 9 feet in wet coastal areas. A stand of this fern reaching its ultimate Height: of 9 feet tall, growing in the shadows of a woodland, would be a sight to see. I imagine it would look like an ancient forest where dinosaurs roamed.

Image of 1975 John Kipping

Woodwardia does well in woodlands or next to streams, moist bogs, springs or ponds and even containers. This fern can even grow in full sun if extra moisture is given during our Northwest drought period. The stalks were used by Native Americans to make baskets. The placement of the sori resembles links on a metal chain and where the common name "giant chain fern", comes from. Named after Thomas J. Woodward, British botanist, 1745–1820.
Cultivation: Woodwardia is not very frost tolerant so grow in a woodland or protected area.
Record Notes: Name checked with The Plant List on 9/12/2012 by Mona Bourell.

Woodwardia media Blechnaceae !

INFO
Common Name: Common Rasp Fern
Perennial Fern/Pteridophyte
Native Range: E. Australia
Synonomy: Doodia media R.Br.
Description: clumping fern, spreading slowly by stolons, bearing slightly hairy, narrow, pinnate fronds to 16" tall. New growth emerges very coppery red in winter and spring. Part sun to full shade, average watering. Plants are found over a large area of Eastern and Southeastern Australia, some forms should be hardy to about 20°F without damage. To keep this species looking good, it can be given an occasional haircut in late January or February, just as the new fronds show signs of starting to push. Remove all old growth and it will be a much nicer, cleaner plant.
Record Notes: Frost sensitive according to accession record 1989-0290 "2 dead, frozen, 3/7/91 in B73."

Wurmbea stricta — Colchicaceae !

INFO
Common Name:
Perennial Geophyte
Flowers White to pink
Native Range: South Africa: Cape
Synonymy: Onixotis stricta (Burm.f.) Wijnands, Pontederia stricta Burm.f. ,Dipidax triquetra (L.f.) Baker ; Dipidax rosea Salisb.; Onixotis triquetra (L.f.) Mabb. ; Anthericum bulbine Houtt..; Melanthium triquetrum L.f.; Melanthium junceum Jacq.

Description: South. Afr. : perennial-Geophyte, Helophyte-Ht up to 0.5 m.in states: EC, NC, WC

Wurmbea stricta is a deciduous, winter-growing geophyte reaching up to 0.6 m high. The subterranean storage organ is a deep-seated, irregularly shaped corm surrounded by dark brown membranous outer tunics, and produces three narrow, very straight, erect or suberect, dark green leaves that resemble knitting needles. Its striking star-shaped flowers are produced alternately along an elongated spike, the tepals varying in colour from pure white to pale pink. Each tepal has a small claw at the base and two prominent, deep pink glands that produce nectar. Vast quantities of seed are produced in attractive erect, narrowly egg-shaped capsules..
Wurmbea stricta is a common species in seasonally inundated swamps and pools, and in roadside ditches, occurring in heavy clay soil. It grows in full sun and is found throughout the southwestern, western and northern parts of the Western Cape, and in southern Namaqualand. It likes company and forms large colonies, often flowering en masse. The flower spikes appear from late winter to late spring, blooming for a period of two to three weeks.
Derivation of name and historical background
Until recently [2007] Wurmbea stricta was included in the genus Onixotis and before then was known as Dipidax triquetra. Recent molecular studies have led to the genus Onixotis being combined with Wurmbea. The genus Wurmbea is named after F. von Wurmb, a Dutch merchant in Java. The specific epithet stricta is derived from the Latin, meaning very straight, and refers to the straight leaves that resemble knitting needles.

Wyethia helenioides — Asteraceae !

INFO
Common Name: mules ears
Perennial Herbaceous
Flowers Yellow
Native Range: California Endemic
Description: Plants 3–7 dm, densely tomentose, often becoming ± glabrous
Leaves: basal blades 25–45 cm, elliptic to obovate
Inflorescence: peduncle 1–6 cm; outer phyllaries 40–70 mm, narrowly ovate, leaf-like, spreading, often > rays, inner shorter, ± erect; chaff scales 15–20 mm
Ray flowers 13–21; ligule 25–50 mm
Disk flowers: corollas 10–11 mm
Fruit 12–15 mm, ± hairy; pappus scales 2–several, 1–5 mm, lanceolate to triangular, ± hairy
Chromosomes: 2n=38
Ecology: Open grassland, scrub
Elevation: < 2000 m.
Bioregional distribution: s North Coast Ranges, c Sierra Nevada Foothills, Central Western California.± glabrous plants approach W. glabra

Cultivation: Information from the Jepson Horticultural Database for Wyethia helenioides
Given excellent drainage (modification of compacted or other water-holding soils may be necessary) and absence of frequent summer water (distance from water-loving plants), grows especially well in zone 7 and also in zones 14, 15, 16, 17, 22, 23, and 24.

Given excellent drainage (modification of compacted or other water-holding soils may be necessary), absence of frequent summer water (distance from water-loving plants), and full or part shade (morning and winter sun may be tolerated), grows in zones 8, 9, 19, 20, and 21.

Difficult; needs special care in all zones; has complex requirements

x Amarcrinum memoria-corsii Amaryllidaceae !

INFO
Common Name: Crinodonna lily
Perennial Geophyte
Height: 2-3ft. Spread: 2-3ft.
Synonomy: × Crindonna memoria-corsii Ragion., × Crindonna corsii (Ragion.) Stapf

Description: Amarcrinum memoria-corsii (Crinodonna) - An evergreen bulb that is the result of the intergeneric cross of Crinum moorei and Amaryllis belladonna. It produces evergreen 2 inch wide by two feet long strap-shaped leaves reminiscent of Crinum and lightly scented, large rose pink flowers in umbels on 2 foot stalks resembling the flowers of Amaryllis belladonna, although they actually have a narrow curved tube closer to that of a Crinum flower. The flowers are quite fragrant and bloom from spring into summer and sometimes into fall.
Cultivation: Plant in full sun to partial shade and provide moderate irrigation. Evergreen to 20-25 degrees F and cold hardy to around 10 degrees F.
Record Notes: Name checked with Tropicos on 8/5/2011 by Mona Bourell.

x Amarcrinum memoria-corsii 'Album' Amaryllidaceae ?

INFO
Common Name:
Perennial Geophyte
Flowers White Jun
Parentage: Amaryllis belladonna × Crinum moorei
Description: × Amarcrinum are hybrids between Amaryllis and Crinum. These plants have tidy leaves and bear large umbels of long lasting, fragrant flowers on tall scapes during late summer and autumn.

Deciduous in summer.
Record Notes: Cultivar name not found used in the trade with internet search, however from the Pacific Bulb Society: "'Born Free' has white flowers and was the first white Amarcrinum." Not clear if this is the same.

Taxon Family Spelling Checked

x Heucherella 'Stoplight' Saxifragaceae !

INFO
Common Name: Stoplight Foamy Bells
Perennial Herbaceous
Height: 1-2ft. Spread: 1ft.
Flowers White Spring
Parentage: Heuchera x Tiarella
Description: The most dramatically colored of all Foamy Bells (plants are a cross between Heuchera and Tiarella). 'Stoplight' is even brighter than 'Sunspot', and guaranteed to bring garden visitors to a sudden halt. Nip off the spikes of white flowers to preserve the integrity of the leaf color. PPAF
Cultivation: moist but well-drained, organic-enriched soil. Attractive to hummingbirds, rarely troubled by deer. Heucherellas perform beautifully in flower borders and in containers. A better performer in the north than in the south, their life span tends to increase as the average temperature is lowered. Heucherellas grow most vigorously and have the stongest colors when grown in partial shade (preferably afternoon shade). They can also be grown in full shade but their growth rate will be very slow. Some varieties can withstand full sun in northern climates if they have consistant moisture, but their colors tend to fade with the intensity of the sun. The soil should be amended with organic matter prior to planting. It should also have good drainage and a neutral pH. Heucherellas are evergreen in areas with mild winters. If properly sited out of the way of winter winds and with reliable snow cover, gardeners in northern regions may also find their heucherellas acting as evergreens. If the plant looks tattered by early spring, shear off any damaged leaves to make room for the vibrant new foliage which will fill in quickly. Propagate by division in either spring or fall.
Record Notes: Spelling checked in google search 5/9/2006.

Taxon Family Spelling Checked

x Heucherella 'Strike it Rich Pink Gem' Saxifragaceae ?

INFO
Common Name: foamy bells
Perennial Herbaceous
Height: 0.75ft.
Flowers Pink May, Jun
Parentage: Heuchera x Tiarella
Description: Heucherella, commonly called foamy bells, is an intergeneric hybrid between a variety of Heuchera and a variety of Tiarella. It is generally more compact and delicate in appearance than its Heuchera parent. 'HERTN042' is a new, pink-flowered cultivar that is being marketed as part of the Strike It Rich series. It is noted for its compact habit, light pink flowers and maple like silver-green leaves with purple veining. The true parents of this plant are unknown. This is a clump-forming perennial that forms a basal mound of foliage to 8" high. Lobed leaves are silvery green with contrasting purple veins. Tiny, pink, star-shaped flowers bloom in panicles atop erect stems rising above the foliage clump to 14" tall in late spring to early-summer. 'HERTN042' has apparently been sold at some point the past under the name of Heucherella 'Pink Whispers'. U.S. Plant Patent PP16,829 was issued to Heucherella 'HERTN042' on July 18, 2006.

Cultivation: Best grown in organically rich, humusy, medium moisture, well-drained soils in full sun to part shade. Performs well in full sun in the north, but prefers some shade (particularly in the heat of the afternoon) in the south. In the St. Louis area, best foliage color may occur in sunny spots with part afternoon shade. Scorch and general foliage decline usually occur if soils are allowed to dry out. If grown in full sun, consistent moisture is particularly important. Remove stems of faded flowers to encourage additional bloom and to tidy plantings so that the attractive foliage can be fully appreciated. In cold winter climates, a winter mulch applied after the ground freezes will help prevent root heaving.
Propagation: Divide clumps in spring every 3-4 years
Record Notes: Received orginally as Heucherella 'Pink Gem', this name was not found used in the trade as such. However, the name Heucherella 'Strike it Rich Pink Gem' is commonly used in the trade, 2/4/2008. Assuming this is the same plant, check description.

x Homoglad '(Gladiolus tristis x Homoglossum watsonium)' ! Iridaceae

INFO
Common Name:
Perennial Geophyte
Height: 1-2ft. Spread: 0.5ft.
Flowers Yellow, Brown, White Spring
Parentage: Gladiolus tristis x Homoglossum watsonium
Description: This is a beautiful early spring bulb with large flowers and slender foliage. The blooms are variable- some will be pale yellow with some darker brown streaks on the top petals, while others will be more flushed with color. In evening they are fragrant. These are a cross between Gladiolus tristis & Homoglossum watsonium (which has now been renamed Gladiolus watsonium). G. tristis gives this hybrid its fragrance & G. watsonium gives it it's coloring. The flowers occur on long stems & sometimes will fall over so underplanting with another plant is sometimes helpful.
Cultivation: Sun-Part Shade; Low-Average water; reported to be deer resistant.
Record Notes: Name x Homoglad is validly published (Homoglad Ingram- J. Roy. Hort. Soc. 92: 310. 1967.) for a generic cross between (Gladiolus tristis x Homoglossum watsonium). 4/3/2006 TROPICOS.

x Sycoparrotia semidecidua — Hamamelidaceae !

INFO
Common Name:
Perennial Tree
Height: 10-12ft. Spread: 15-18ft.
Flowers Red, Brown Feb, Mar
Parentage: Sycopsis sinensis x Parrotia persica
Description: Spreading shrub grown for its unusual colored flowers. Small flowers open from brown, woolly buds and reveal red anthers surrounded by brown bracts.
Glossy dark green leaves with yellow autumn colour. A cross between Sycopsis and Parrotia which makes a fine if unusual addition to an early spring garden FEB-MAR
Cultivation: Grow in moist but well drained, moderately fertile, humus-rich, neutral to acid soil in full sun or partial shade. Shelter from strong, cold drying winds. Prune only to maintain a healthy framework. Generally free from pests and diseases.
Propagation: Take semi-ripe cuttings in summer.
Record Notes: Species name checked with IPNI; cultivar name found used in the trade with internet search, 5/24/2007.

Xanthorrhoea macronema — Xanthorrhoeaceae !

INFO Common Name: bottle brush grass tree
Perennial Graminoid
Native Range: Australia
Description: Description: Trunk absent; stem sometimes branched below ground; crowns 1-many, in a loosely upright or deflexed tuft.

Leaves obtrullate, irregularly rounded depressed-cuneate or concave in T.S., usually 2.3–3.5 mm wide, 1.2–1.8 mm thick, light to dark green, not glaucous.

Scape 1–1.6 m long, 4–5 mm diam.; spike less than a tenth as long as scape, 5–13 cm long, 1.4–2 cm diam.; cluster bracts obscure; packing bracts shortly acute to acute, glabrous. Outer tepals acute, beaked, without proboscis, glabrous. Inner tepals prominent, erect, with proboscis, glabrous except for very few hairs at apex,

In Australia Flowering: July–Jan.

Distribution and occurrence: Grows in sclerophyll forest on coastal sands and ranges; north from the Sydney region.
NSW subdivisions: NC, CC
Other Australian states: Qld

Cultivation: In cultivation it is best suited to temperate and warm temperate climates, where it will tolerate some drought and moderate freezes.
Record Notes: Name checked with APNI, 6/18/2010.

Taxon Family Spelling Checked

Xanthorrhoea preissii Xanthorrhoeaceae !

INFO
Common Name: Grasstree, western Blackboy
Perennial Tree
Height: 9ft. Spread: 3-6ft.
Native Range: Western Australia
Synonomy: synonym: Xanthorrhoea pecoris F.Muell.
synonym: Xanthorrhoea reflexa D.A.Herb.
Description: Western Australia species with an upright or slightly twisted trunk reaching 20' at maturity. Common name balga (blackboy). Height less than 9', width 3-6'.
Commonly known as Grass Trees. Very slow growing (but long lived) so you can put this one into a planter. Long, reed-like leaves extend from the tip of the "trunk". Erect spikes of creamy blossoms erupt from the top of the tree. Young plants may need 20 years or more just to form a trunk! All species require a well drained soil as they are prone to root rot. A sunny location is essential and it is reported to be frost tolerant. The glassy resin which exudes from the trunks was previously used in varnish and other products. The flakes of resin were collected from around the base of the stem, heated and rolled into balls. The gum sometimes oozed out into balls on the trunk on the northern side caused by the heat of the sun or after bushfires. This was then reheated and used to attach stone flakes to wooden spear shafts or woomeras as well as joining and repairing broken implements. The dry flower stalks were used as fishing spear shafts to which were glued three or four prongs. The flowering spikes of the grass tree were soaked in water to make a sweet drink, fresh or slightly fermented. The tough leaves were used as knives to cut meat. Insect larvae were also harvested from the inside the old flower stalks and from the dead bases. Fires were lit by rubbing two pieces of the dry stalk together. Europeans harvested the gum to make varnishes and lacquers. During World War II many cans of tinned food sent to the Australian troops in the Pacific had a protective coat of grass tree varnish to stop the containers from rusting.
Cultivation: 28 inches annual rainfall. Sand, sandy loam, loam or gravel soils.
Record Notes: Name checked with The Plant List on 4/23/2014 by Mona Bourell.

Xerochrysum bracteatum — Asteraceae !

INFO
Common Name: Strawflower, Golden Everlasting, paper daisy, Golden Everlasting Daisy
Annual - Perennial Herbaceous
Height: 1-3ft. Spread: 1ft.
Native Range: South and East Australia
Synonymy: Bracteantha bracteata (Vent.) Anderb. & Haegi, Helichrysum bracteatum (Vent.) Andrews, Xeranthemum bracteatum Vent.
Description: Bracteantha [Xerochrysum] bracteata is a most variable and widespread plant, found on the margins of dry rainforest in north Queensland, through to coastal areas of Western Australia, and seemingly every imaginable habitat in between except wet or heavily shaded areas. They generally flower from spring to autumn, although those varieties which occur in arid inland areas flower in the cooler months.
Plants may be either annual, or woody perennials. The specific name "bracteata" refers to the prominent and numerous, dry, papery bracts, which are often incorrectly referred to as petals.

In the early 19th century, noted East German horticulturist Herren Ebritsch, at Amstadt, developed many unusual colour forms by intensive breeding of the annual varieties, and these were widely distributed in European gardens in the 1850s. These varieties known as Strawflowers, have globular heads, the bracts of which are coloured maroon through to bronze. The bracts remain cupped around the flowers rather than opening out flat to the perfect flower head of Golden Everlasting. Seed of the Strawflowers is still commonly available. Variability of wild populations of Bracteantha bracteata is seen in vigour, foliage and flower.
Strawflower is an upright, warm-weather annual or short lived perennial with daisy-like flowerheads in yellow, pink, bronze, cream, purple or white. Strawflower has thin, lance shaped, grayish green leaves up to 5 in (12.7 cm) long, and sandpapery, hollow, branching stems that may reach 3-4 ft (0.9-1.2 m) in height. From late spring until fall, strawflower bears flowerheads about 2 in (5.1 cm) across singly or in few-flowered clusters on the ends of the branches. What look like ray flowers or petals are actually bracts (modified leaves) surrounding the central corolla. The bracts are papery with a straw-like, crackly texture, hence the common name. The corolla is like the disc of more typical

Taxon Family Spelling Checked

Xeronema callistemon — Xeronemataceae !

INFO
Common Name: Poor Knights Lily
Perennial Herbaceous
Flowers Red
Native Range: New Zealand
Description: A wonderful, architectural plant - spear-like leaves to 80cm and spikes of rust-red bottle brush flowers late spring/early summer. A drammatic container plant in cold winter areas. It was discovered in 1920 at a minute site on Poor Knight's Island, and was considered an extraordinary find at the time. It is still regarded as an extremely rare plant.
Iris-like clumps of broad, succulent, sword-shaped leaves and spikes of bright red half-bottlebrush flowers. Sometimes classified in the Liliaceae, Agavaceae, Phormiaceae, or Xeronemataceae families.
Cultivation: Full sun, tender and difficult. Must have good drainage and full sun, is frost tender (over-winter under cover in cold winter areas) and is most successful in a pot. Flowers best when somewhat root-bound. Some give an annual dousing with sea water.
Propagation: Propagate by seed or divide established plants.

Xerophyllum tenax Melanthiaceae !

INFO
Common Name: common beargrass, basket grass
Perennial Geophyte
Height: 3-3.5ft.
Flowers White
Native Range: California
Synonomy: Helonias tenax
Description: This species was long used by Native Americans who wove it into baskets. Its fibrous leaves, which turn from green to white as they dry, are tough, durable, and easily dyed and manipulated into tight waterproof weaves.

Xylococcus bicolor Ericaceae ?

INFO
Common Name: mission manzanita
Perennial Shrub
Native Range: S Calif - Baja Calif
Synonomy: Arctostaphylos bicolor
Description: Shrub, buried
Stem erect, < 2.5 m; bark shredding; twigs canescent
Leaves generally alternate, evergreen, 2.5–4.5 cm, elliptic to oblong, leathery; margin entire, rolled under; upper surface glabrous, dark green; lower surface densely white- to gray-hairy
Inflorescence: panicle, ± reflexed, dense, bracted; bractlets 2; pedicels not jointed to flower
Flower: sepals generally 5; petals 5, fused, < 9 mm, urn-shaped, white or pinkish, hairy; stamens generally 10, filaments woolly in lower 1/2, anthers dehiscent by separate slits, awned; ovary superior, hairy, chambers generally 5, placentas axile
Fruit: drupe, < 9 mm wide, smooth; stones generally 5, fused into a smooth, 3–5-seeded unit
Chromosomes: 2n=26
Ecology: Chaparral
Elevation: < 650 m.
Bioregional distribution: South Coast, s Channel Islands (Santa Catalina Island)
Distribution outside California: n Baja California

Record Notes: Name checked with The Plant List and found to be a synonym for Arctostaphylos bicolor (Nutt.) A. Gray, 5/12/2011.

Yucca aloifolia Agavaceae !

INFO
Common Name: aloe yucca, spanish bayonet
Perennial Tree
Height: 10ft. Spread: 5ft.
Flowers white (purple tinged)
Native Range: S. US, West Indies, Mexico
Synonomy: Yucca serrulata Haworth
Description: Plants forming colonies of rosettes, arborescent, to 7 m. Stems 1–3, erect or somewhat declining, simple or sparingly branched. Leaf blade erect, dark green, flattened or slightly concave, thick, 12–40 × 2.5–6 cm, rigid, margins sharply denticulate or entire, rarely filiferous with straight fibers. Inflorescences pendent, paniculate, arising 1/4–1/2 within rosettes, somewhat conical, 4.5–6.1 dm, glabrous or slightly pubescent; peduncle scapelike, to 3 dm. Flowers pendent, to 7 cm; perianth globose; tepals spreading, connate basally for less than 1 mm, creamy white tinged with green or purple near base, lanceolate, 3–4 × 1.2–2.2 cm; filaments ca. 2 cm; anthers 2–3 mm; pistil light green, 3–4 × 0.8–1 cm; ovary stipitate, 2–5 cm; style 5 mm; stigmas distinct. Fruits pendent, baccate, without core, indehiscent, 3.5 –5 × 2–2.6 cm, with fleshy, succulent, purple pulp. Seeds dull black, round-ovate, 5–7 mm diam., 2.5 mm thick.
Flowering fall. Sand dunes or shell mounds near coasts; to 1800 m; Ala., Fla., Ga., La., Miss., N.C., S.C., Tex., Va.; Mexico; West Indies; Central America.

Yucca aloifolia has been widely cultivated, and horticultural forms (or varieties, depending upon the source) differ in the striping of yellow and white on the leaves. Results of DNA studies by K. H. Clary (1997) show a close relationship between this species and Y. gloriosa

Taxon Family Spelling Checked

Yucca aloifolia 'Marginata' Agavaceae !

INFO
Common Name: Dagger Plant, Spanish Bayonet, Yucca
Perennial Succulent
Height: 5-20ft. Spread: 2ft.
Flowers White
Description: Erect trunk, 3-5 in (7.6-12.7 cm) in diameter, reaching up to 5-20 ft (1.5-6.1 m) tall before it becomes top heavy and topples over. When that happens, the tip turns upward and keeps on growing. The trunk is armed with sharp pointed straplike leaves each about 2 in (0.6 ft) long. The young leaves near the growing tip stand erect; older ones are reflexed downward, and the oldest wither and turn brown, hanging around the lower trunk like an Hawaiian skirt. Eventually the tip of the trunk develops a 2 ft (0.6 m) long spike of white, purplish-tinged flowers, each blossom about 4 in (12.7 cm) across. After flowering, the trunk stops growing, but one or more lateral buds are soon formed, and the uppermost becomes a new terminal shoot. Any other buds become branches, but these are usually few, and the plant has an open, airy habit. Spanish bayonet also produces new buds, or offshoots, near the base of the trunk, forming a thicket. There are several cultivars available, including 'Marginata' with yellow margined leaves
Cultivation: Spanish bayonet will flourish in full sun with light, sandy soil.
Light: Prefers full sun but does well in partial sun.
Moisture: Drought tolerant
Hardiness: USDA Zones 8-11

Propagation: By root cuttings, and offsets. Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Name checked in Google Search 3/4/2005.

Yucca endlichiana Agavaceae !

INFO
Common Name:
Perennial
Native Range: Mexico: Coahuila
Cultivation: Native to a small, very dry area in the Chihuahua Desert in southern Coahuila, Mexico, between 1000 and 1200 m (3300 and 3900 ft.), it has remained obscure and virtually unknown in cultivation. It is best suited to the desert garden, can take moderate freezes with ease and will make a very unusual and easy care ground cover.
Record Notes: Name found with IPNI search, 8/16/2006.

Yucca filamentosa Agavaceae !

INFO
Common Name: Adam's needle, bear grass, weak-leaf yucca
Perennial Succulent
Height: 1-3ft. Spread: 3-6ft.
Flowers White
Native Range: North Carolina - Mississippi
Synonomy: Yucca smalliana, Yucca concava, Yucca filamentosa var. concava, Yucca filamentosa var. smalliana, Yucca flaccida, Yucca recurvifolia
Description: Adam's needle looks a little like a small palm, but is actually more closely related to the lilies. The evergreen leaves of Adam's needle are straplike, about 1 in (2.5 cm) wide and up to 2-3 ft (0.6-0.9 m) long. The leaves are basal; that is, they all originate from one point, taking the form of a rosette. The margins of the leaves are decorated with long curly threads or "filaments" that peel back as the leaf grows, eventually dropping off on older leaves. The inflorescence is very showy and borne on an erect spike up to 12 ft (3.7 m) high (taller in warm climates, shorter where winters are cold). There are up to several dozen individual flowers on an inflorescence, they are white and about 2 in (5 cm) long. The plant dies after flowering and fruiting, but produces lateral buds that start new plants around the edges of the original.
Cultivation: Light: prefers full sun, but will tolerate some light shade
Moisture: average to dry soil - drought tolerant
Hardiness: USDA Zones 5-10
Propagation: By seed, root cuttings and offshoots. When you dig up a yucca to transplant, about a year later you often find the site ringed with baby yuccas growing from pieces of root left behind!
Record Notes: Name checked with IPNI, 3/31/2008.

Yucca filamentosa 'Bright Edge' Agavaceae !

INFO
Common Name:
Perennial
Height: 1.5ft.
Flowers White
Description: The Adam's Needle, 'Yucca filamentosa 'Bright Edge', is a clump forming perennial with tufts of dark green leaves edged in golden yellow. In the summer time, the foliage is even more golden. The creamy, bell-shaped, white flowers hover over the foliage. The red coloration on the long blades highlight the flowering crown. 'Bright Edge' has a plant height of 18" and a spread of 20".
Cultivation: It should be planted in full sun and in a well-drained area. 'Bright Edge' looks great in a subject garden or in containers and is also a butterfly attractor.
Record Notes: Species name checked with IPNI, cultivar name found used in the trade with internet search, 3/31/2008.

Yucca rostrata Agavaceae !

INFO
Common Name: Beaked Blue Yucca, Beaked Yucca, Big Bend Yucca
Perennial Succulent
Height: 4-10ft. Spread: 4ft.
Flowers White
Native Range: Mexico - Texas
Description: This is truly one of the most elegant (and user friendly) yuccas for the garden, and certainly one of the most hardy of the trunk-forming species. The narrow powder blue foliage radiates out from the head of the central stalk like one of those "Rostrata-farian" hairdos. In 10 years, expect a 4' trunked specimen (eventually to 10'+) that will branch with age...much faster in alkaline soils. The species name rostrata refers to the fruit, which truly resembles the beak of a bird.
Cultivation: Frost Tolerance: Hardy to 10°F (-12°C) Sun Exposure: Full sun to light shade, Zones sunset: 7-24, USDA: 8-12; Watering Needs: Little to moderate water, good drainage.

Propagation: Seeds, offsets. Can be transplanted easily.
Record Notes: Name checked in IPNI 3/4/2005.

Zamia furfuracea Zamiaceae !

INFO
Common Name: Cardboard Sago, Cardboard Cycad
Perennial Cycad
Height: 3.5'ft.
Native Range: Mexico
Description: The plant has a short, sometimes subterranean trunk up to 20 cm broad and high, usually marked with scars from old leaf bases. It grows very slowly when young, but its growth accelerates after the trunk matures. Including the leaves, the whole plant typically grows to 1.3 m tall with a width of about 2 m.

The leaves radiate from the center of the trunk; each leaf is 50-150 cm long with a petiole 15-30 cm long, and 6 -12 pairs of extremely stiff, pubescent (fuzzy) green leaflets. These leaflets grow 8-20 cm long and 3-5 cm wide. Occasionally, the leaflets are toothed toward the tips. The circular crowns of leaves resemble fern or palm fronds. They are erect in full sun, horizontal in shade.

This plant produces a rusty-brown cone in the center of the female plant. The egg-shaped female (seed-producing) cones and smaller male (pollen-producing) cone clusters are produced on separate plants. Pollination is by certain insects, namely the belid weevil Rhopalotria mollis

Cultivation: This plant is easy to care for and grows best in moist, well-drained soil. They do well in full sun or shade, but not in constant deep shade. They are fairly salt- and drought-tolerant, but should be protected from extreme cold. They should occasionally be fed with palm food. After Cycas revoluta, this is probably the most popular cycad species in cultivation. In temperate regions it is commonly grown as a houseplant and, in subtropical areas, as a container or bedding plant outdoors
Propagation: Cardboard Cycad plant can only be reproduced by the fleshy, brightly crimson-colored seeds produced by the female plants. The germination process is very slow and difficult to achieve in cultivation; as a result, many plants sold for horticultural use are illegally collected in the wild, leading to the species being classified as Vulnerable
Record Notes: Spelling checked in GRIN database 12-17

Zamia integrifolia Zamiaceae !

INFO
Common Name: Florida arrowroot
Perennial Cycad
Height: 1ft.
Native Range: Florida
Synonomy: Zamia Floridana; Zamia umbrosa; Zamia silvicola
Description: Stem subterranean, or leaf-bearing apex exposed. Leaves 2--10 dm; petiole unarmed; leaflets 6--17 cm × 2--18 mm, linear, often twisted, very stiff, dark glossy green, 7--23-veined; margins often revolute, entire or with small teeth to slight denticulations near apex. Pollen cones generally 2--5 per plant, narrowly cylindric, 5--16 cm, tapering slightly at apex. Seed cones cylindric-ellipsoid, 5--19 cm, blunt at apex; ovules 2 per sporophyll. Seeds drupelike, oblong to ovoid, somewhat angular, 1.5--2 cm, outer coat bright orange. 2 n = 16.

Period of receptivity and maturation of seeds December--March. Hammocks, pine-oak woodlands, scrub, and shell mounds; 0--30 m; Fla., Ga.; West Indies.

Once common to locally abundant, Zamia integrifolia is becoming increasingly uncommon as its habitats are being destroyed. The species is now considered "endangered" in Florida.

The choice of specific epithet to use for our species follows the conclusion reached by D. W. Stevenson (1987).

Controversy has long existed over the classification of Zamia in Florida. Recent researchers, however, have concluded that only one species is present in the flora. The several binomials applied to our Zamia reflect variability in plant vigor, leaf shape, leaflet width, number of marginal teeth and veins per leaflet, and geographic distribution. Forms with wide leaflets—" Zamia umbrosa "—are restricted to coastal hammocks of northeastern Florida and southeastern Georgia and appear to be quite distinct from plants of the remainder of Florida— Z . integrifolia and " Z . floridana ." Especially robust forms have been described as " Zamia silvicola ." Studies by D. B. Ward (n.d.) indicate that these features have a genetic basis, but formal recognition of these different phases as species does

Zamia polymorpha — Zamiaceae !

INFO
Common Name:
Perennial Cycad
Native Range: Mexico: Yucatan & Belize
Description: A small cycad with a subterranean caudex up to 10cm in diameter. It usually has 2-3 leaves, between 0.5 and 1.5 m long, and a prickled petiole. The leaflets are lanceolate with serrated margins in the upper two thirds, and up to 30cm long, and 8cm wide.

Distribution & Habitat:
It is found on the Yucatan Peninsula of Mexico and along the eastern coast of Belize.

Cultivation: Sunny, sandy, well drained position.
Record Notes: Name checked with IPNI, 9/29/2008.

ACCESSION
SFBG# 2008-0769 DEACCESSIONED Rec'd: 9/20/2008

Taxon Family Spelling Checked

Zamia standleyi — Zamiaceae !

INFO
Common Name:
Perennial Cycad
Height: 3ft.
Native Range: Honduras
Description: Long-lanceolate leaflets with spreading evenly spaced marginal teeth and bearing the impression, in the form of a slight to pronounced fold, of the adjacent leaflets as a result of the imbricate pytxis and compression of emerging leaves and leaflets. Additionally, the seed cones have a distinctive curved, long-acuminate tip. The most similar species in terms of these leaflet characters is Z. poeppigiana. Zamia poeppigiana has leaflets with parallel margins and a pronounced falcate base, 10-15 leaves per plant that are 1-3 m long with 20-40 pairs of leaflets, and adult plants with trunks to 4 m tall. In contrast, Z. standleyi has upwardly subfalcate leaflet margins and a straight attenuate base, 1-5 leaves per plant that are less than 1 meter long with 10-15 pairs of leaflets, and adult plants with subterranean stems.

Distribution and habitat: Zamia standleyi is endemic to Honduras where it occurs from sea level to 200 m in semi-xeric woodlands to secondary scrub vegetation and even at the margins of cultivated gardens and fields.

Cultivation: Likes dry conditions under tree canopy, tropical.
Propagation: May need male & female plants to produce viable seeds.
Zamia standleyi seems to do well even in disturbed situations. Numerous cones and seeds are produced in habitat and in cultivation. However, caution should be exercised in the case of assuming viable seed production in this species. A female plant growing at the New York Botanical Garden has produced from 1-2 cones with mature seeds every year for the past 17 years. Yet no male plants or other pollen producing plants were present and pollination did not occur. Accordingly these "seeds" contain no embryos.
Record Notes: Name checked with IPNI, 6/27/2007.

ACCESSION
SFBG# 2007-0285 RARE DEACCESSIONED Rec'd: 6/27/2007
Source: San Francisco Conservatory of Flowers
Orig. Qty: 2
Material: 2 gallon
Intended for use in: Mesoamerican Cloud Forest, or Dry Mexico

Notes

12/10/2009 Mona Bourell — Jason reports plants in both 68C and 68G have died. Last checked, one in 68C on 2/3/2009; one in 68G on 5/18/2009. Deaccessioned.

11/9/2009 Olivier Thénault — Not found in 0G1 during nursery inventory, 10/19/2009. 1 plant last checked 11/4/2007 by Jeanne. For ancient plant garden, 2gal. Location removed 11/9/2009.

5/19/2009 Mona Bourell — Plant in 68G does not look healthy.

9/9/2008 David Kruse-Pickler — 2 plants moved to Ancient Plant Garden staging. Record to be updated after confirmation of planting.

9/12/2007 Mona Bourell — Last seen in 0C1 6/26/2007.

6/27/2007 Mona Bourell — Jeanne is keeping them in the greenhouse for possibility of producing viable seeds.

Taxon Family Spelling Checked

Zantedeschia sprengeri 'Red Sox' Araceae !

INFO
Common Name: calla lily
Perennial Herbaceous
Height: 1-1.5ft.
Flowers Red Late spring through late summer.
Description: Red Sox is a true red Calla, a very rare shade indeed for this family. The large blooms offer strokes of scarlet and crimson above a yellow base, a magnificent effect made more prominent by long, sturdy stems. Each flowering stem of this plant sends up 4 blooms, so you not only get the most prized color in the Calla family, but an extra armful of blooms from every bulb!
Red Sox is a dwarf Calla, reaching just 16 to 20 inches high. Floriferous and dependable, it is a superb addition to the cutting garden, border, or containers of all kinds. Although the plant is compact and petite, the blooms are not, which means you can grow more Callas than ever in the same amount of garden space!
The deep forest-green foliage complements the flowers beautifully, too, with its scattered white flecks and elegant shape. Happy in partial to half shade, Red Sox is ideal for cutting, container growth, and garden beauty. North of zone 9, dig up the bulb in fall and stored indoors for replanting next spring.
Cultivation: Grow in moist, humus-rich soil in sun. Can handle in marginal aquatic habitats. If water is not constant, plant in shade.
Propagation: When the flowering diminishes a little (after several years), dig up the bulb in early fall and divide it into new plants.
Record Notes: Species name checked with IPNI; cultivar name published in 2002, in New Zealand: http://www.freepatentsonline.com/20020184689.html.

Zauschneria californica 'Brilliant Smith' — Onagraceae X

INFO
Common Name:
Perennial
Height: 1ft.
Flowers Orange-red Aug, Sept, Oct
Native Range: USA
Description: Green foliage contrasts beautifully with the brilliant, orange-red trumpets that cover this 1' plant in late summer and fall. The flowers are unusually open for a California Fuschia, and it needs more water than Zauschneria Californica. It does best with weekly watering, good drainage and full sun. It was discovered in Del Norte County near the south fork of the Smith River.

Cultivation: Needs more water than Zauschneria Californica. It does best with weekly watering, good drainage and full sun.
Propagation: Vegetative propagation such as cuttings only (named cultivar). Seeds will not produce identical clones.
Record Notes: Species name checked with IPNI; cultivar name found used in the trade with internet search, 9/14/2007.

Taxon Family Spelling Checked

Zelkova serrata — Ulmaceae !

INFO
Common Name:
Perennial Tree
Native Range: China, Taiwan, Japan, Korea, Kuril Islands
Synonomy: Z. formosana, Z. keaki, Z. acuminata, Z. hirta, Z. tarokoensis, Z. japonica
Description: Trees, to 30 m tall, d.b.h. to 1 m, deciduous. Bark grayish white to grayish brown, exfoliating. Branchlets brownish purple to brown, pubescent or glabrescent. Winter buds conic-ovoid to ovoid. Stipules brownish purple, lanceolate, 7-9 mm. Petiole 2-6 mm, pubescent; leaf blade elliptic to ovate-lanceolate, 3-10 × 1.5-5 cm, papery to thickly papery, glabrous or abaxially sparsely pubescent along veins, adaxially sparsely hispid, base slightly oblique, rounded, or shallowly cordate, margin serrate to crenate, apex caudate-acuminate; secondary veins 9-15 on each side of midvein. Male flowers: shortly pedicellate, ca. 3 mm in diam. Perianth (5 or)7(or 8)-parted to middle. Female flowers: subsessile, ca. 1.5 mm in diam. Perianth 4- or 5 (or 6)-parted. Ovary pubescent. Drupes pea green, subsessile, 2.5-3.5 mm in diam., surface covered by an irregular network of low ridges. Fl. Apr, fr. Sep-Nov. 2n = 28.

The bark and leaves are used medicinally.

Native habitat: Valleys, beside streams; 500-2000 m. Anhui, Fujian, Gansu (Qin Ling), N Guangdong, Guizhou, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Liaoning (Dalian), Shaanxi (Qin Ling), Shandong, Sichuan, Taiwan, Zhejiang [Japan, Korea, Russia (Kuril Islands)].

Masses in S part of bed, near and along paved path.

Notes

3/12/2014 Marc Johnson — Location 29G removed from database by Marc Johnson on 3/12/2014 Reason: Not found during inventory, 2/20/2014 by Marc Johnson and Patrick Quinn. Location Details at time of removal: Bed: 29G (Mesoamerican Cloud Forest) # Plants: 1 Planting Date: Last Checked: 2/25/1995 Location Notes: Location ID: 9950

12/6/2012 Marc Johnson — #13 on Bed 24H inventory map by David Kruse-Pickler and Lisa Roberts, 7/16/2009.

12/8/2010 Olivier Thériault — 2 plants not found in bed 29H during inventory, 11/30/2010. Planting date 2/8/1993, last checked 2/25/1995. Location record removed.

7/2/2010 David Kruse-Pickler — No plants found in bed 24D during inventory. Location record deleted. 1 plant, 2/8/1993 planting date, 7/10/2005 last checked date by Tony Morosco. Notes:northeast corner of bed.

11/5/2009 David Kruse-Pickler — No plants in bed 24F. Location record deleted. 13 plants, 7/14/2008 planting date, 7/14/2008 last checked date by Patrick Quinn, notes: propagated from divisions

7/22/2008 Mona Bourell — Patrick reports planting out to 24F, ca. 12-13 plants but in one clump so quantity is not precise, 7/14/2008

7/13/2005 Tony Morosco — One seen in bed 24D during inventory on 8 July 2005, quantity in that bed reduced from 3 to 1.

Taxon Family Spelling Checked

Zieria pilosa Rutaceae !

INFO
Common Name: hairy zieria
Perennial Shrub
Height: 1.5 - 3ft. Spread: 3ft.
Flowers White to pale pink
Native Range: New South Wales
Synonomy: Zieria obovata (C.T.White) J.A.Armstr.
Description: Shrub to 1 m high; branches hirsute with mostly simple hairs or rarely glabrous, not warted, glabrescent.
Leaves with central leaflet linear to oblong or lanceolate, 10–25 mm long, 2–7 mm wide, apex obtuse and ± mucronate, margins entire, ± flat; upper surface dark green, ± glabrous, lower surface paler, ± hirsute; petiole 1.5–4 mm long.
Inflorescences shorter than leaves, usually 1-flowered, but up to 7. Calyx lobes narrow-triangular, 2–3.5 mm long, hairy. Petals 3–4.5 mm long, imbricate, white to pale pink, pubescent.
Cocci not warted, glabrous to hirsute, lacking an appendage, Flowers all year but chiefly spring to early summer.
In dry and wet sclerophyll forest or in heath in sandy soils.
Cultivation: Well drained soil. Moderate watering. Full sun. Hardy to 20-25 deg.
Record Notes: Name checked with The Plant List on 5/21/2012 by Mona Bourell, and found to be unresolved. May be a synonym for Zieria obovata (C.T. White) J.A.Armstr.
Armstrong, J.A. (2002) Zieria (Rutaceae): a systematic and evolutionary study. Australian Systematic Botany 15(3): 408-411, Figs 95-97 [comb. et stat. nov.]

Ziziphus jujuba Rhamnaceae !

INFO
Common Name: Chinese jujube
Perennial Tree
Native Range: Se Europe to China
Description: Trees small, rarely shrubs, deciduous, to 10 m tall, spinose or unarmed. Bark brown or gray-brown, with long reduced branches, without buds; branchlets (new branches) purple-red or gray-brown, flexuose, smooth, with 2 stipular spines or not; long spines erect, to 3 cm, stout; short spines recurved, developed from old branches; annual branchlets pendulous, green, solitary or 2-7-fascicled on short shoots. Stipular spines slender, caducous; petiole 1-6 mm, or to 1 cm on long shoots, glabrous or sparsely puberulent; leaf blade abaxially pale green, adaxially dark green, ovate, ovate-elliptic, or elliptic-oblong, 3-7 × 1.5-4 cm, papery, abaxially ± puberulent on major veins or glabrous, adaxially glabrous, 3-veined from base, base slightly asymmetric, subrounded, margin crenate-serrate, apex obtuse or rounded, rarely acute, mucronulate. Flowers yellow-green, bisexual, 5-merous, glabrous, solitary or 2-8 crowded in axillary cymes, shortly pedunculate. Pedicel 2-3 mm. Sepals ovate-triangular, adaxially distinctly keeled. Petals obovate, ca. as long as stamens, clawed at base. Disk orbicular, thick, fleshy, 5-lobed. Ovary basally slightly immersed in disk; style 2-cleft to half. Drupe red at maturity, turning red-purple, oblong or narrowly ovoid, 2-3.5 cm, (0.5-)1.5-2 cm in diam.; mesocarp fleshy, thick, sweet- or sour-tasting; stone acute or obtuse at both ends, 2-loculed, 1- or 2-seeded; fruiting pedicel 2-5 mm or longer. Seeds compressed-orbicular, ca. 1 × 0.8 cm, Fl. May-Jul, fr. Aug-Oct. 2n = 24*, 36*, 48*. Branches with spines.

● Mountains, hills, sunny dry slopes, plains, also widely cultivated; below 1700 m. Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Nei Mongol, Ningxia, Shaanxi, Shandong, Shanxi, Sichuan, Xinjiang, Yunnan, Zhejiang [cultivated in Africa, Asia, Europe, and North and South America].

Kirkbride et al. (Taxon 55: 1049-1050. 2007 ["2006"]) proposed the name Ziziphus jujuba for conservation against the paratautonym Z. zizyphus.

Zygopetalum mackaii Orchidaceae !

INFO
Common Name:
Perennial Epiphyte or terrestrial
Flowers Brown/purple fall
Native Range: Brazil
Cultivation: Hardiness Range of 10B - 11. zygopetalum mackaii mature's to a height of 15" to 20" / 40cm to 50cm. prefersa partially shady environment, or partial sun. It is essential that the soil should be moist at all times. Cultivation requirements are similar to those of cryophilic Cymbidia,with an extra period of rest in the summer . During that time ,deny the plant any watering for 8 weeks .
Record Notes: Originally in records as Z. mackayi, name not found. Most likely = Z. mackaii Hook., name found with IPNI search, 8/16/2006.
